THE STUDY OF LANGUAGE

This best-selling textbook provides an engaging and user-friendly introduction to the study of language. Assuming no prior knowledge of the subject, Yule presents information in bite-sized sections, clearly explaining the major concepts in linguistics through all the key elements of language. This sixth edition has been revised and updated throughout, with substantial changes to the chapters on phonetics, grammar and syntax, and eighty new study questions. To increase student engagement and to foster problem-solving and critical-thinking skills, the book includes twenty new tasks. An expanded and revised online study guide provides students with further resources, including answers and tutorials for all tasks, while encouraging lively and proactive learning. This is the most fundamental and easy-to-use introduction to the study of language.

GEORGE YULE has taught linguistics at the University of Edinburgh, the University of Hawai‘i, the University of Minnesota and Louisiana State University.
“A genuinely introductory linguistics text, well suited for undergraduates who have little prior experience thinking descriptively about language. Yule’s crisp and thought-provoking presentation of key issues works well for a wide range of students.”

Elise Morse-Gagne, Tougaloo College

“The Study of Language is one of the most accessible and entertaining introductions to linguistics available. Newly updated with a wealth of material for practice and discussion, it will continue to inspire new generations of students.”

Stephen Matthews, University of Hong Kong

“Its strength is in providing a general survey of mainstream linguistics in palatable, easily manageable and logically organized chunks. The chapter divisions allow for considerable flexibility, which has proved particularly important after recently restructuring our courses and reorganizing the order in which to cover the topics.”

Nigel Musk, University of Linköping

“Perfect for the beginners’ level introductory linguistics course, both in style and content.”

Hugh Buckingham, Professor of Linguistics, Louisiana State University

“Very clear and easy to read for beginners; user-friendly and non-threatening …; chapters are in absorbable bite-size chunks.”

Jean Aitchison, Professor of Language and Communication, University of Oxford

“An impressive breadth of coverage … clear presentation, lucid style and accessibility … a solid foundation for further study in linguistics as well as being a pleasure to read in its own right.”

Alan Smith, Web Journal of Modern Language Linguistics

“Comprehensive, concise and compelling, this updated and highly accessible textbook is the obvious choice for the beginner language student.”

Torill Hestetræet, University of Bergen

“This textbook is an excellent overview of the central topics in linguistics and how linguists study language.”

Daniel W. Hieber, Rosetta Stone, eLanguage.net
“… provides a clear and concise introduction to linguistics suitable for beginners.”

Preface
In This New Edition

Thanks to a comprehensive survey of instructors familiar with earlier editions, I received a lot of good advice and suggestions for improvements to this new edition. As a result, a number of revisions have been made to the internal organization of all chapters, with more than thirty new figures and tables. There are also substantial revisions in Chapters 3 (Phonetics), 7 (Grammar) and 8 (Syntax), plus additional material on adjacency pairs, brain development, coherence, complementary distribution, diphthongs, emotional deixis, human breathing while speaking, insertion sequences, language typology, morpheme acquisition, pragmatic markers, referential meaning, slips of the tongue, stone tool use, subjects, objects and word order. I hope these revisions and additions will make the book more informative, easier to read and overall more user-friendly.

In addition, there are eighty new study questions and twenty new tasks. The majority of the tasks are data-based and designed to foster analytic, problem-solving and critical-thinking skills. There are new examples from languages as diverse as Bislama, Cree, Lolovoli, Japanese, Malagasy, Manambu and Rotokas. Additional topics explored in the study of English include adjacency pairs, American versus British spelling, auxiliary movement, children’s slips, English as a lingua franca, genitives, lenition, long and short vowels, mateship, morphophonology, prepositions and semantic roles, and the trochaic stress pattern. An expanded and revised Study Guide providing answers and tutorials for all the tasks can be found on the book’s website www.cambridge.org/yule6.
To the Student

In *The Study of Language*, I have tried to present a comprehensive survey of what is known about language and also of the methods used by linguists in arriving at that knowledge. There continue to be interesting developments in the study of language, but it is still the case that any mature speaker of a language has a more comprehensive “unconscious” knowledge of how language works than any linguist has yet been able to describe. Consequently, as you read each of the following chapters, take a critical view of the effectiveness of the descriptions, the analyses and the generalizations by measuring them against your own intuitions about how your language works. By the end of the book, you should feel that you do know quite a lot about both the internal structure of language (its form) and the varied uses of language in human life (its function), and also that you are ready to ask more of the kinds of questions that professional linguists ask when they conduct their research.

At the end of each chapter, there is a section where you can test and apply what you have learned. This section contains:

- Study questions that you can use to check if you have understood some of the main points and important terms introduced during that chapter
- Tasks that extend the topics covered in the chapter, mostly through exercises in data analysis, with examples from English and a wide range of other languages
- Discussion topics/projects that offer opportunities to consider some of the more general, sometimes controversial, language-related topics and to develop your own opinions on issues involving language
- Further reading suggestions provided to help you find more detailed treatments of all the topics covered in that chapter

The origins of this book can be traced to introductory courses on language taught at the University of Edinburgh, the University of Minnesota and Louisiana State University, and to the suggestions and criticisms of hundreds of students who forced me to present what I had to say in a way they could understand. An early version of the written material was developed for Independent Study students at the University of Minnesota. Later versions have had the benefit of expert advice from a lot of teachers working with diverse groups in
different situations. I am particularly indebted to Professor Hugh Buckingham, Louisiana State University, for sharing his expertise and enthusiasm over many years as a colleague and friend.

For feedback and advice in the preparation of recent editions of the book, I would like to thank Jean Aitchison (University of Oxford), Linda Blanton (University of New Orleans), Karen Currie (Federal University of Espíritu Santo), Mary Anna Dimitrakopoulos (Indiana University, South Bend), Thomas Field (University of Maryland, Baltimore), Anthony Fox (University of Leeds), Agustinus Gianto (Pontifical Biblical Institute), Gordon Gibson (University of Paisley), Katinka Hammerich (University of Hawai‘i), Raymond Hickey (Essen University), Richard Hirsch (Linköping University), Fiona Joseph (University of Wolverhampton), Eliza Kitis (Aristotle University), Mairead MacLeod, Terrie Mathis (California State University, Northridge), Megan Melançon (Georgia College), Stephen Matthews (University of Hong Kong), Robyn Najar (Flinders University), Eric Nelson (University of Minnesota), Jens Reinke (Christian Albrechts Universität zu Kiel), Philip Riley (Université de Nancy 2), Rick Santos (Fresno City College), Joanne Scheibman (Old Dominion University), Robert Sinclair, Royal Skousen (Brigham Young University), Michael Stubbs (Universität Trier), Mary Talbot (University of Sunderland), Sherman Wilcox (University of New Mexico) and Jay Yule.

For my own introductory course, I remain indebted to Willie and Annie Yule, and, for my continuing enlightenment, to Maryann Overstreet.
The suspicion does not appear improbable that the progenitors of man, either the males or females, or both sexes, before they had acquired the power of expressing their mutual love in articulate language, endeavoured to charm each other with musical notes and rhythm.

Darwin (1871)

In Charles Darwin’s vision of the origins of language, early humans had already developed musical ability prior to language and were using it “to charm each other.”
This may not match the typical image that most of us have of our early ancestors as rather rough characters wearing animal skins and not very charming, but it is an interesting speculation about how language may have originated. It remains, however, a speculation.

We simply don’t know how language originated. We do know that the ability to produce sound and simple vocal patterning (a hum versus a grunt, for example) appears to be in an ancient part of the brain that we share with all vertebrates, including fish, frogs, birds and other mammals. But that isn’t human language. We suspect that some type of spoken language must have developed between 100,000 and 50,000 years ago, well before written language (about 5,000 years ago). Yet, among the traces of earlier periods of life on earth, we never find any direct evidence or artifacts relating to the speech of our distant ancestors that might tell us how language was back in the early stages. Perhaps because of this absence of direct physical evidence, there has been no shortage of speculation about the origins of human speech.
The Divine Source

In the biblical tradition, as described in the book of Genesis, God created Adam and “whatsoever Adam called every living creature, that was the name thereof.” Alternatively, following a Hindu tradition, it is Sarasvati, wife of Brahma, who is credited with bringing language to humanity. In most religions, there appears to be a divine source who provides humans with language. In an attempt to rediscover this original divine language, a few experiments have been carried out, with rather conflicting results. The basic hypothesis seems to have been that, if human infants were allowed to grow up without hearing any language around them, then they would spontaneously begin using the original God-given language.

The Greek writer Herodotus reported the story of an Egyptian pharaoh named Psammetichus (or Psamtik) who tried the experiment with two newborn babies more than 2,500 years ago. After two years of isolation except for the company of goats and a mute shepherd, the children were reported to have spontaneously uttered, not an Egyptian word, but something that was identified as the Phrygian word bekos, meaning “bread.” The pharaoh concluded that Phrygian, an older language spoken in part of what is modern Turkey, must be the original language. That seems very unlikely. The children may not have picked up this “word” from any human source, but as several commentators have pointed out, they must have heard what the goats were saying. (First remove the -kos ending, which was added in the Greek version of the story, then pronounce be- as you would the English word bed without -d at the end. Can you hear a goat?)

King James the Fourth of Scotland carried out a similar experiment around the year 1500 and the children were reported to have spontaneously started speaking Hebrew, confirming the King’s belief that Hebrew had indeed been the language of the Garden of Eden. About a century later, the Mogul emperor Akbar the Great also arranged for newborn babies to be raised in silence, only to find that the children produced no speech at all. It is unfortunate that Akbar’s result is more in line with the real-world outcome for children who have been discovered living in isolation, without coming into contact with human speech. Very young children living without access to human language in their early years grow up with no language at all. This was true of Victor, the wild boy of Aveyron in France, discovered near the end of the eighteenth century, and also of Genie, an American child whose special life circumstances came to light in the 1970s (see Chapter 12). From
this type of evidence, there is no “spontaneous” language. If human language did emanate from a divine source, we have no way of reconstructing that original language, especially given the events in a place called Babel, “because the Lord did there confound the language of all the earth,” as described in Genesis (11: 9).
The Natural Sound Source

A quite different view of the beginnings of language is based on the concept of natural sounds. The human auditory system is already functioning before birth (at around seven months). That early processing capacity develops into an ability to identify sounds in the environment, allowing humans to make a connection between a sound and the thing producing that sound. This leads to the idea that primitive words derive from imitations of the natural sounds that early men and women heard around them. Among several nicknames that he invented to talk about the origins of speech, Jespersen (1922) called this idea the “bow-wow” theory.
The “Bow-Wow” Theory

In this scenario, when different objects flew by, making a CAW-CAW or COO-COO sound, the early human tried to imitate the sounds and then used them to refer to those objects even when they weren’t present. The fact that all modern languages have some words with pronunciations that seem to echo naturally occurring sounds could be used to support this theory. In English, in addition to cuckoo, we have splash, bang, boom, rattle, buzz, hiss, screech and of course bow-wow.

Words that sound similar to the noises they describe are examples of onomatopoeia. While a number of words in any language are onomatopoeic, it is hard to see how most of the soundless things (e.g. “low branch”) as well as abstract concepts (e.g. “truth”) could have been referred to in a language that simply echoed natural sounds. We might also be rather skeptical about a view that seems to assume that a language is only a set of words used as “names” for things.
The “Pooh-Pooh” Theory

Another of Jespersen’s nicknames was the “pooh-pooh” theory, which proposed that speech developed from the instinctive sounds people make in emotional circumstances. That is, the original sounds of language may have come from natural cries of emotion such as pain, anger and joy. By this route, presumably, *Ouch!* came to have its painful connotations. But *Ouch!* and other interjections such as *Ah!, Ooh!, Phew!, Wow!* or *Yuck!* are usually produced with sudden intakes of breath, which is the opposite of ordinary talk. We normally produce spoken language as we breathe out, so we speak while we exhale, not inhale. In other words, the expressive noises people make in emotional reactions contain sounds that are not otherwise used in speech production and consequently would seem to be rather unlikely candidates as source sounds for language.
The Social Interaction Source

Another proposal involving natural sounds was nicknamed the “yo-he-ho” theory. The idea is that the sounds of a person involved in physical effort could be the source of our language, especially when that physical effort involved several people and the interaction had to be coordinated. So, a group of early humans might develop a set of hums, grunts, groans and curses that were used when they were lifting and carrying large bits of trees or lifeless hairy mammoths.

The appeal of this proposal is that it places the development of human language in a social context. Early people must have lived in groups, if only because larger groups offered better protection from attack. Groups are necessarily social organizations and, to maintain those organizations, some form of communication is required, even if it is just grunts and curses. Sounds, then, would have some principled use in the social interaction of early human groups. This is an important idea involving the uses of humanly produced sounds. It does not, however, reveal the origins of the sounds produced. Apes and other primates live in social groups and use grunts and social calls, but they have not developed the capacity for speech.
The Physical Adaptation Source

Instead of looking at types of sounds as the source of human speech, we can look at the types of physical features humans possess, especially those that may have supported speech production. We can start with the observation that, at an early stage, our ancestors made a major transition to an upright posture, with bi-pedal (on two feet) locomotion. This really changed how we breathe. Among four-legged creatures, the rhythm of breathing is closely linked to the rhythm of walking, resulting in a one pace – one breath relationship. Among two-legged creatures, the rhythm of breathing is not tied to the rhythm of walking, allowing long articulations on outgoing breath, with short in-breaths. It has been calculated that “human breathing while speaking is about 90% exhalation with only about 10% of time saved for quick in-breaths” (Hurford, 2014: 83).

Other physical changes have been found. The reconstructed vocal tract of a Neanderthal man from around 60,000 years ago suggests that some consonant-like sound distinctions were possible. Around 35,000 years ago we start to find features in fossilized skeletal structures that resemble those of modern humans. In the study of evolutionary development, there are certain physical features that are streamlined versions of features found in other primates. By themselves, such features would not guarantee speech, but they are good clues that a creature with such features probably has the capacity for speech.
Teeth and Lips

Human teeth are upright, not slanting outwards like those of apes, and they are roughly even in height. They are also much smaller. Such characteristics are not very useful for ripping or tearing food and seem better adapted for grinding and chewing. They are also very helpful in making sounds such as for . Human lips have much more intricate muscle interlacing than is found in other primates and their resulting flexibility certainly helps in making sounds like , , and . In fact, the and sounds are the most widely attested in the vocalizations made by human infants during their first year, no matter which language their parents are using.
Mouth and Tongue

The human mouth is relatively small compared to other primates and can be opened and closed rapidly. It is also part of an extended vocal tract that has more of an L-shape than the straight path from front to back in other mammals. In contrast to the fairly thin flat tongue of other large primates, humans have a shorter, thicker and more muscular tongue that can be used to shape a wide variety of sounds inside the oral cavity. In addition, unlike other primates, humans can close off the airway through the nose to create more air pressure in the mouth. The overall effect of these small differences taken together is a face with more intricate muscle interlacing in the lips and mouth, capable of a wider range of shapes and a more rapid and powerful delivery of sounds produced through these different shapes.
Larynx and Pharynx

The human larynx or “voice box” (containing the vocal folds) differs significantly in position from the larynx of other primates such as monkeys. In the course of human physical development, the assumption of an upright posture moved the head more directly above the spinal column and the larynx dropped to a lower position. This created a longer cavity called the pharynx, above the vocal folds, which acts as a resonator for increased range and clarity of the sounds produced via the larynx. Other primates have almost no pharynx. One unfortunate consequence of this development is that the lower position of the human larynx makes it much more possible for the human to choke on pieces of food. Monkeys may not be able to use their larynx to produce speech sounds, but they do not suffer from the problem of getting food stuck in their windpipe. In evolutionary terms, there must have been a big advantage in getting this extra vocal power (i.e. a larger range of sounds) to outweigh the potential disadvantage from an increased risk of choking to death.
The Tool-Making Source

In the physical adaptation view, one function (producing speech sounds) must have been superimposed on existing anatomical features (teeth, lips) previously used for other purposes (chewing, sucking). A similar development is believed to have taken place with human hands and some believe that manual gestures may have been a precursor of language. By about two million years ago, there is evidence that humans had developed preferential right-handedness and had become capable of making stone tools. Tool making, or the outcome of manipulating objects and changing them using both hands, is evidence of a brain at work.
The Human Brain

The human brain is not only large relative to human body size, it is also lateralized, that is, it has specialized functions in each of the two hemispheres. (More details are presented in Chapter 12.) Those functions that control the motor movements involved in complex vocalization (speaking) and object manipulation (making or using tools) are very close to each other in the left hemisphere of the brain. That is, the area of the motor cortex that controls the muscles of the arms and hands is next to the articulatory muscles of the face, jaw and tongue. It may be that there was an evolutionary connection between the language-using and tool-using abilities of humans and that both were involved in the development of the speaking brain.

A recent study kept track of specific activity in the brains of experienced stonemasons as they crafted a stone tool, using a technique known to have existed for 500,000 years. The researchers also measured the brain activity of the same individuals when they were asked to think (silently) of particular words. The patterns of blood flow to specific parts of the brain were very similar, suggesting that aspects of the structure of language may have developed through the same brain circuits established earlier for two-handed stone tool creation.

If we think in terms of the most basic process involved in primitive tool-making, it is not enough to be able to grasp one rock (make one sound); the human must also bring another rock (other sounds) into contact with the first in order to develop a tool. In terms of language structure, the human may have first developed a naming ability by consistently using one type of noise (e.g. *beer*). The crucial additional step was to bring another specific noise (e.g. *good*) into combination with the first to build a complex message (*beer good*). Several thousand years of development later, humans have honed this message-building capacity to a point where, on Saturdays, watching a football game, they can drink a sustaining beverage and proclaim *This beer is good*. As far as we know, other primates are not doing this.
The Genetic Source

We can think of the human baby in its first few years as a living example of some of these physical changes taking place. At birth, the baby’s brain is only a quarter of its eventual weight and the larynx is much higher in the throat, allowing babies, like chimpanzees, to breathe and drink at the same time. In a relatively short period of time, the larynx descends, the brain develops, the child assumes an upright posture and starts walking and talking.

This almost automatic set of developments and the complexity of the young child’s language have led some scholars to look for something more powerful than small physical adaptations over time as the source of language. Even children who are born deaf (and do not develop speech) become fluent sign language users, given appropriate circumstances, very early in life. This seems to indicate that human offspring are born with a special capacity for language. It is innate, no other creature seems to have it and it is not tied to a specific variety of language. Is it possible that this language capacity is genetically hard-wired in the newborn human?
The Innateness Hypothesis

As a solution to the puzzle of the origins of language, the innateness hypothesis would seem to point to something in human genetics, possibly a crucial mutation or two, as the source. In the study of human development, a number of gene mutations have been identified that relate to changes in the human diet, especially those resulting in an increase in calorie intake, possibly tied to the ability to digest starch in food and a substantial increase in glucose production. These changes are believed to have enhanced blood flow in the brain, creating the conditions for a bigger and more complex brain to develop. We are not sure when these genetic changes might have taken place or how they might relate to the physical adaptations described earlier. However, as we consider this hypothesis, we find our speculations about the origins of language moving away from fossil evidence or the physical source of basic human sounds toward analogies with how computers work (e.g. being pre-programmed or hard-wired) and concepts taken from the study of biology and genetics.

The investigation of the origins of language then turns into a search for the special “language gene” that only humans possess. In one of the tasks at the end of this chapter (Task G on page 9), you can investigate the background to the discovery of one particular gene (FOXP2) that is thought to have a role in language production.

If we are indeed the only creatures with this special capacity for language, then will it be completely impossible for any other creature to produce or understand language? We will try to answer that question in Chapter 2.
Study Questions

1 When did written language develop?
2 When can we say the human auditory system has begun working?
3 What percentage of human breathing while speaking normally consists of in-breaths?
4 What is the difference between the position of the larynx in humans and other primates?
5 Why are interjections such as Ooh! or Yuck! considered to be unlikely sources of human speech sounds?
6 What is the basic idea behind the “bow-wow” theory of language origin?
7 Why is it difficult to agree with Psammetichus that Phrygian must have been the original human language?
8 Where is the pharynx and how did it become an important part of human sound production?
9 Why do you think that young deaf children who become fluent in sign language would be cited in support of the innateness hypothesis?
10 With which of the six “sources” would you associate the following quotation?

Chewing, licking and sucking are extremely widespread mammalian activities, which, in terms of casual observation, have obvious similarities with speech.

(MacNeilage, 1998)
Tasks

A What is the connection between the Heimlich maneuver and the development of human speech?

B What exactly happened at Babel and why is it used in explanations of language origins?

C What are the arguments for and against a teleological explanation of the origins of human language?

D The Danish linguist Otto Jespersen, who gave us the terms “bow-wow” and “pooh-pooh” for theories about language origins, dismissed both of these ideas in favor of another theory. What explanation did Jespersen (1922, chapter 21) favor as the likely origin of early speech?

E In the study of the relationship between brain, tools and language in human development, two distinct types of stone tools are typically mentioned. They are described as Oldowan tools and Acheulean tools. What is the difference between them, when were they used, and which of them was investigated in the recent study involving blood flow in the brain, as described in the chapter?

F The idea that “ontogeny recapitulates phylogeny” was first proposed by Ernst Haeckel in 1866 and is still frequently used in discussions of language origins. Can you find a simpler or less technical way to express this idea?

G When it was first identified, the FOXP2 gene was hailed as the “language gene.” What was the basis of this claim and how has it been modified?

H In his analysis of the beginnings of human language, William Foley comes to the conclusion that “language as we understand it was born about 200,000 years ago” (1997:73). This is substantially earlier than the dates (between 100,000 and 50,000 years ago) that other scholars have proposed. What kinds of evidence and arguments are typically presented in order to choose a particular date “when language was born”?

I What is the connection between the innateness hypothesis, as described in this chapter, and the idea of a Universal Grammar?
Discussion Topics/Projects

I In this chapter we didn’t address the issue of whether language has developed as part of our general cognitive abilities or whether it has evolved as a separate component that can exist independently (and is unrelated to intelligence, for example). What kind of evidence do you think would be needed to resolve this question?

(For background reading, see chapter 4 of Aitchison, 2000.)

II A connection has been proposed between language, tool-using and right-handedness in the majority of humans. Is it possible that freedom to use the hands, after assuming an upright bipedal posture, resulted in certain skills that led to the development of language? Why did we assume an upright posture? What kind of changes must have taken place in our hands?

One evening in the mid-1980s my wife and I were returning from an evening cruise around Boston Harbor and decided to take a waterfront stroll. We were passing in front of the Boston Aquarium when a gravelly voice yelled out, “Hey! Hey! Get outa there!” Thinking we had mistakenly wandered somewhere we were not allowed, we stopped and looked around for a security guard or some other official, but saw no one, and no warning signs. Again the voice boomed, “Hey! Hey you!” As we tracked the voice we found ourselves approaching a large, glass-fenced pool in front of the aquarium where four harbor seals were lounging on display. Incredulous, I traced the source of the command to a large seal reclining vertically in the water, with his head
extended back and up, his mouth slightly open, rotating slowly. A seal was talking, not
to me, but to the air, and incidentally to anyone within earshot who cared to listen.

Deacon (1997)

There are a lot of stories about creatures that can talk. We usually assume that they are
fantasy or fiction or that they involve birds or animals simply imitating something
they have heard humans say (as Terrence Deacon discovered was the case with the
loud seal in Boston Aquarium). Yet we believe that creatures can communicate,
certainly with other members of their own species. Is it possible that a creature could
learn to communicate with humans using language? Or does human language have
properties that make it so unique that it is quite unlike any other communication
system and hence unlearnable by any other creature? To answer these questions, we
first look at some special properties of human language, then review a number of
experiments in communication involving humans and animals.
Communication

We should first distinguish between specifically communicative signals and those that may be unintentionally informative signals. Someone listening to you may become informed about you through a number of signals that you have not intentionally sent. She may note that you have a cold (you sneezed), that you are not at ease (you shifted around in your seat), that you are disorganized (non-matching socks) and that you are from somewhere else (you have a strange accent). However, when you use language to tell this person, *I’m one of the applicants for the vacant position of senior brain surgeon at the hospital*, you are normally considered to be intentionally communicating something.

Humans are capable of producing sounds and syllables in a stream of speech that appears to have no communicative purpose, as in glossolalia, or “speaking in tongues,” which is associated with the religious practices of Pentecostal churches. These outpourings sound like language, but with no speaker control it is not intentional communication. We might say the same thing about some of the chirping and singing produced by birds. We also don’t assume that the blackbird is communicating anything by having black feathers and sitting on a branch. However, the bird is considered to be sending a communicative signal with the loud squawking produced when a cat appears on the scene. So, when we talk about distinctions between human language and animal communication, we are considering both in terms of their potential for intentional communication.
Properties of Human Language

While we tend to think of communication as the primary function of human language, it is not a distinguishing feature. All creatures communicate in some way, even if it is not through vocalization. However, we suspect that other creatures are not reflecting on the way they create their communicative messages or reviewing how they work (or not). That is, one barking dog is probably not offering advice to another barking dog along the lines of “Hey, you should lower your bark to make it sound more menacing.” They’re not barking about barking. Humans are clearly able to reflect on language and its uses (e.g. “I wish he wouldn’t use so many technical terms”). This is reflexivity. The property of reflexivity (or “reflexiveness”) accounts for the fact that we can use language to think and talk about language itself, making it one of the distinguishing features of human language. Indeed, without this general ability, we wouldn’t be able to reflect on or identify any of the other distinct properties of human language. We will look in detail at another five of them: displacement, arbitrariness, productivity, cultural transmission and duality.
Displacement

When your pet cat comes up to you calling *meow*, you are likely to understand this message as relating to that immediate time and place. If you ask your cat what it has been up to, you will probably get the same *meow* response. Animal communication seems to be designed exclusively for the here and now. It isn’t used to relate events that are removed in time and place. When your dog says *GRRR*, it means *GRRR, right now*, because dogs aren’t capable of communicating *GRRR, last night, over in the park*. In contrast, human language users are normally capable of producing messages equivalent to *GRRR, last night, over in the park*, and then going on to say *In fact, I’ll be going back tomorrow for some more*. Humans can refer to past and future time. This property of human language is called displacement. It allows language users to talk about things not present in the immediate environment. Displacement allows us to talk about things and places (e.g. angels, fairies, Santa Claus, Superman, heaven, hell) whose existence we cannot even be sure of.

We could look at bee communication as a small exception because it seems to have some version of displacement. When a honeybee finds a source of nectar and returns to the beehive, it can perform a dance routine to communicate to the other bees the location of this nectar. Depending on the type of dance (round dance for nearby and tail-wagging dance for further away), the other bees can work out where this newly discovered feast can be found. Doesn’t this ability of the bee to indicate a location some distance away mean that bee communication has at least some degree of displacement as a feature? Yes, but it is displacement of a very limited type. It just doesn’t have the range of possibilities found in human language. Certainly, the bee can direct other bees to a food source. However, it must be the most recent food source. It cannot be *that delicious rose bush on the other side of town that we visited last weekend*, nor can it be, as far as we know, possible future nectar in bee heaven.
Arbitrariness

It is generally the case that there is no “natural” connection between a linguistic form and its meaning. The connection is quite arbitrary. We can’t just look at the Arabic word كلب and from its shape determine that it has a natural and obvious meaning any more than we can with its English translation form dog. The linguistic form has no natural or “iconic” relationship with that hairy four-legged barking object out in the world. This aspect of the relationship between words and objects is described as arbitrariness. It is possible to make words “fit” the concept they indicate, as in Figure 2.1, but this type of game only emphasizes the arbitrariness of the connection that normally exists between a word and its meaning.

There are some words in language with sounds that seem to “echo” the sounds of objects or activities and hence seem to have a less arbitrary connection. English examples are cuckoo, crash, slurp, squelch or whirr. However, these onomatopoeic words are relatively rare in human language.

For the majority of animal signals, there does appear to be a clear connection between the conveyed message and the signal used to convey it. This impression may be closely connected to the fact that, for any animal, the set of signals used in communication is finite. Each variety of animal communication consists of a limited set of vocal or gestural forms. Many of these forms are only used in specific situations (to establish territory) or at particular times (to find a mate).
Cultural Transmission

While we inherit physical features such as brown eyes and dark hair from our parents, we do not inherit their language. We acquire a language in a culture with other speakers and not from parental genes. An infant born to Korean parents in Korea, but adopted and brought up from birth by English speakers in the United States, will have physical characteristics inherited from his or her natural parents, but will inevitably speak English. A kitten, given comparable early experiences, will produce *meow* regardless.

This process whereby a language is passed on from one generation to the next is described as cultural transmission. It is clear that humans are born with some kind of predisposition to acquire language in a general sense. However, we are not born with the ability to produce utterances in a specific language such as English. We acquire our first language as children in a culture.

The general pattern in animal communication is that creatures are born with a set of specific signals that are produced instinctively. There is some evidence from studies of birds as they develop their songs that instinct has to combine with learning (or exposure) in order for the right song to be produced. If those birds spend their first seven weeks without hearing other birds, they will instinctively produce songs or calls, but those songs will be abnormal in some way. Human infants, growing up in isolation, produce no “instinctive” language.
Productivity

Humans are continually creating new expressions by manipulating their linguistic resources to describe new objects and situations. This property is described as productivity (or “creativity” or “open-endedness”) and essentially means that the potential number of utterances in any human language is infinite.

The communication systems of other creatures are not like that. Cicadas have four signals to choose from and vervet monkeys have thirty-six vocal calls. Nor does it seem possible for creatures to produce new signals for novel experiences or events. The honeybee, normally able to communicate the location of a nectar source to other bees, will fail to do so if the location is really “new.” In one experiment, a hive of bees was placed at the foot of a radio tower and a food source placed at the top. Ten bees were taken to the top, given a taste of the delicious food, and sent off to tell the rest of the hive. The message was conveyed via a bee dance and the whole gang buzzed off to get the free food. They flew around in all directions, but couldn’t locate the food. (It’s probably one way to make bees really mad.) The problem seems to be that bee communication has a fixed set of signals for communicating location and they all relate to horizontal distance. The bee cannot manipulate its communication system to create a “new” message for vertical distance. According to Karl von Frisch, who conducted the experiment, “the bees have no word for up in their language” and they can’t invent one.

This lack of productivity in animal communication can be described in terms of fixed reference. Each signal in the communication system of other creatures seems to be fixed in terms of relating to a particular occasion or purpose. This is particularly true of scent-based signaling, as in the pheromones (a chemical substance) released by insects such as female moths as they try to contact a mate. It’s a case of one scent, one meaning.

Among our closer relatives, there are lemurs (similar to small monkeys) in Madagascar that have only three basic calls. In the vervet monkey’s repertoire, there is one danger signal CHUTTER, which is used when a snake is around, and another RRAUP, used when an eagle is spotted nearby. These signals are fixed in terms of their reference and cannot be manipulated. What might count as evidence of productivity in the monkey’s communication system would be an utterance of something like CHUTT-RRAUP when a flying creature that looked like a snake came by. Despite a lot of laboratory research involving snakes suddenly appearing in the air above them (among other weird experiences), the vervet monkeys didn’t produce a new danger signal. The human, given
similar circumstances, is quite capable of creating a “new” signal, after initial surprise perhaps, by saying something never said before, as in \textit{Hey! Watch out for that flying snake!}
Duality

Human language is organized at two levels simultaneously. This property is called duality (or “double articulation”). When we speak, we have a physical level at which we produce individual sounds, like $n$, $b$ and $i$. As individual sounds, none of these discrete forms has any intrinsic meaning. In a combination such as $bin$, we have another level with a meaning that is different from the meaning of the combination in $nib$. So, at one level, we have distinct sounds, and, at another level, we have distinct meanings. This duality of levels is one of the most economical features of human language because, with a limited set of sounds, we are capable of producing a very large number of sound combinations (e.g. words) that are distinct in meaning.

Among other creatures, each communicative signal appears to be a single fixed form that cannot be broken down into separate parts. Although your dog may be able to produce woof (“I’m happy to see you”), it does not seem to do so on the basis of a distinct level of production combining the separate elements of $w + oo + f$. If the dog was operating with the double level (i.e. duality), then we might expect to hear different combinations with different meanings, such as oowf (“I’m hungry”) and foow (“I’m really bored”).
Talking to Animals

If these properties make human language such a unique communication system, then it would seem extremely unlikely that other creatures would be able to understand it. Some humans, however, do not behave as if this is the case. Riders can say *Whoa* to horses and they stop, we can say *Heel* to dogs and they will follow at heel (well, sometimes), and a variety of circus animals go *Up, Down* and *Roll over* in response to spoken commands. Should we treat these examples as evidence that non-humans can understand human language? Probably not. The standard explanation is that the animal produces a particular behavior in response to a sound stimulus, but does not actually “understand” what the noise means.

If it seems difficult to conceive of animals understanding human language, then it appears to be even less likely that an animal would be capable of producing human language. After all, we do not generally observe animals of one species learning to produce the signals of another species. You could keep your horse in a field of cows for years, but it still won’t say *Moo*. And, in some homes, a new baby and a puppy may arrive at the same time. Baby and puppy grow up in the same environment, hearing the same things, but two years later, the baby is making lots of human speech sounds and the puppy is not. Perhaps a puppy is a poor example. Wouldn’t it be better to work with a closer relative such as a chimpanzee?
Chimpanzees and Language

The idea of raising a chimp and a child together may seem like a nightmare, but this is basically what was done in an early attempt to teach a chimpanzee to use human language. In the 1930s, two scientists (Luella and Winthrop Kellogg) reported on their experience of raising an infant chimpanzee together with their baby son. The chimpanzee, called Gua, was reported to be able to understand about a hundred words, but did not “say” any of them. In the 1940s, a chimpanzee named Viki was reared by another scientist couple (Catherine and Keith Hayes) in their own home, as if she was a human child. These foster parents spent five years attempting to get Viki to “say” English words by trying to shape her mouth as she produced sounds. Viki eventually managed to produce some words, rather poorly articulated versions of *mama*, *papa* and *cup*. In retrospect, this was a remarkable achievement since it has become clear that non-human primates do not actually have a physically structured vocal tract that is suitable for articulating the sounds used in speech. Apes and gorillas can, like chimpanzees, communicate with a wide range of vocal calls, but they just can’t make human speech sounds.
Recognizing that a chimpanzee was not likely to learn spoken language, another scientist couple (Beatrix and Allen Gardner) set out to teach a female chimpanzee called Washoe to use a version of American Sign Language. As described later in Chapter 15, this sign language has all the essential properties of human language and is learned by many congenitally deaf children as their natural first language.

From the beginning, the Gardners and their research assistants raised Washoe like a human child in a comfortable domestic environment. Sign language was always used when Washoe was around and she was encouraged to use signs, even her own incomplete “baby-versions” of the signs used by adults. In a period of three and a half years, Washoe came to use signs for more than a hundred words, ranging from airplane, baby and banana through to window, woman and you. Even more impressive was Washoe’s ability to take these forms and combine them to produce “sentences” of the type gimme tickle, more fruit and open food drink (to get someone to open the refrigerator). Some of the forms appear to have been inventions by Washoe, as in her novel sign for bib and in the combination water bird (referring to a swan), which would seem to indicate that her communication system had the potential for productivity. Washoe also demonstrated understanding of a much larger number of signs than she produced and was capable of holding rudimentary conversations, mainly in the form of question–answer sequences.
At the same time as Washoe was learning sign language, another chimpanzee was being taught (by Ann and David Premack) to use a set of plastic shapes for the purpose of communicating with humans. These plastic shapes represented “words” that could be arranged in sequence to build “sentences.” This chimpanzee was called Sarah and she preferred to arrange the shapes into a vertical order, as shown in Figure 2.2. The basic approach was quite different from that of the Gardners. Sarah was not treated like a human child in a domestic environment. To begin with, she was over five years old when the training began. She was systematically trained to associate the plastic shapes with objects or actions. She remained an animal in a cage, being trained with food rewards to manipulate a set of symbols. Once she had learned to use a large number of the plastic shapes, Sarah was capable of getting an apple by selecting the correct plastic shape (a blue triangle) from a large array. Notice that this symbol is arbitrary since it would be hard to argue for any natural connection between an apple and a blue plastic triangle. Sarah was also capable of producing “sentences” such as *Mary give chocolate Sarah* and had the impressive capacity to understand complex structures such as *If Sarah put red on green, Mary give Sarah chocolate.* Sarah would get the chocolate.
MARY
GIVE

SARAH
A similar training technique with another artificial language was used (by Duane Rumbaugh) to train a chimpanzee called Lana. The language she learned was called Yerkish and consisted of a set of symbols on a large keyboard linked to a computer. When Lana wanted some water, she had to find and press four symbols to produce the message *please machine give water*, as illustrated in Figure 2.3.
The Controversy

Both Sarah and Lana demonstrated an ability to use what look like word symbols and basic structures in ways that superficially resemble the use of language. There is, however, a lot of skepticism regarding these apparent linguistic skills. It has been pointed out that when Lana used the symbol for “please,” she did not have to understand the meaning of the English word *please*. The symbol for “please” on the computer keyboard might simply be the equivalent of a button on a vending machine and, so the argument goes, we could learn to operate vending machines without necessarily knowing language. This is only one of the many arguments that have been presented against the idea that the use of signs and symbols by these chimpanzees is similar to the use of language.

On the basis of his work with another chimpanzee called Nim, the psychologist Herbert Terrace argued that chimpanzees simply produce signs in response to the demands of people and tend to repeat signs those people use, yet they are treated as if they are taking part in a “conversation.” As in many critical studies of animal learning, the chimpanzees’ behavior is viewed as a type of conditioned response to cues provided (often unwittingly) by human trainers. Herbert’s conclusion was that chimpanzees are clever creatures who learn a certain type of behavior (signing) in order to get rewards and are essentially performing sophisticated “tricks.”

In response, the Gardners argued that they were not animal trainers, nor were they eliciting conditioned responses from Washoe. In complex experiments, designed to eliminate any visual cues, they showed that in the absence of any human, Washoe could produce correct signs to identify objects in pictures. They also emphasize a major difference between Washoe and Nim. While Nim was a research animal in a complex environment, dealing with a lot of different researchers who were often not fluent signers, Washoe lived in a more limited domestic environment with a lot of opportunity for imaginative play and interaction with fluent signers who were also using sign language with each other. They also report that another group of younger chimpanzees learned sign language and occasionally used signs with each other and with Washoe, even when there were no humans present.
In a more recent set of studies, an interesting development relevant to this controversy came about almost by accident. While Sue Savage-Rumbaugh was attempting to train a bonobo (a pygmy chimpanzee) called Matata how to use the symbols of Yerkish, Matata’s adopted baby, Kanzi, was always with her. Although Matata did not do very well, her son Kanzi spontaneously started using the symbol system with great ease. He had learned not by being taught, but by being exposed to, and observing, a kind of language in use at a very early age. Kanzi eventually developed a large symbol vocabulary (over 250 forms). By the age of eight, he was reported to be able to demonstrate understanding of spoken English at a level comparable to a two-and-a-half-year-old human child. There was also evidence that he was using a consistently distinct set of “gentle noises” as words to refer to things such as bananas, grapes and juice. He had also become capable of using Yerkish to ask for his favorite movies, *Quest for Fire* and *Greystoke* (about the Tarzan legend).
Using Language

Important lessons have been learned from attempts to teach chimpanzees how to use forms of language. We have answered some questions. Were Washoe and Kanzi capable of taking part in interaction with humans by using a symbol system chosen by humans and not chimpanzees? The answer is clearly “Yes.” Did Washoe and Kanzi go on to perform linguistically like a human child about to begin pre-school? The answer is just as clearly “No.” Yet, even as we arrive at these answers, we still don’t seem to have a non-controversial definition of what “using language” means.

One solution might be to stop thinking of language, at least in the phrase “using language,” as a single thing that one can either have or not have. We could then say there are (at least) two ways of thinking about “using language.” In a broad sense, language serves as a type of communication system in different situations. In one situation, we look at the behavior of a two-year-old human child interacting with a caregiver as an example of “using language.” In another situation, we observe very similar behavior from chimpanzees when they are interacting with humans. It has to be fair to say that, in both cases, we observe the participants “using language.”

However, there is a difference. Underlying the two-year-old’s communicative activity is the capacity to develop a complex system of sounds and structures, plus computational procedures, that will allow the child to produce extended discourse containing a potentially infinite number of novel utterances. No other creature has been observed “using language” in this sense. It is in this more comprehensive and productive sense that we say that language is uniquely human.
Study Questions

2 What is the difference between a communication system with productivity and one with fixed reference?

3 Why is reflexivity considered to be a special property of human language?

4 What kind of evidence is used to support the idea that language is culturally transmitted?

5 Which English words was Viki reported to be able to say?

6 What property did Washoe’s language seem to have when she used an expression such as “water bird” to refer to a swan?

7 How did the Gardners try to show that Washoe was not simply repeating signs made by interacting humans?

8 If Sarah could use a gray plastic shape to convey the meaning of the word red, which property does her “language” seem to have?

9 What was the name of the “language” that Lana learned?

10 What was considered to be the key element in Kanzi’s language learning?
Tasks

A In studies of communication involving animals and humans, there is sometimes a reference to “the Clever Hans phenomenon.” Who or what was Clever Hans, why was he/she/it famous and what exactly is the “phenomenon”?

B We recognized a distinction early in the chapter between communicative and informative signals. How would “body language” be characterized? Also, what kind of signaling is involved in “distance zones”? What about “eye contact” and “eyebrow flashes”?

C What is meant by “sound symbolism”? How does it relate to arbitrariness?

D

(i) In the study of animal communication, what are “playback experiments”?

(ii) Which forms of animal communication described in this chapter were discovered as a result of playback experiments?

E It has been claimed that “recursion” is a key property of human language, and of human cognition in general. What is recursion? Could it still be a universal property of human language if one language was discovered that had no evidence of recursion in its structure?

F We reviewed studies involving chimpanzees and bonobos learning to communicate with humans. Can only African apes accomplish this task? Are there any studies involving the Asian great ape, the orangutan, learning how to use a human communication system?

G What was the significance of the name given to the chimpanzee in the research conducted by the psychologist Herbert Terrace (1979)?

H Consider these statements about the symbol-using abilities of chimpanzees in animal language studies and decide if they are correct or not. What evidence can be used to argue for or against the accuracy of these statements?

   (1) They can create combinations of signs that look like the telegraphic speech produced by young children.

   (2) They can invent new sign combinations.

   (3) They can understand structures with complex word order, such as conditionals (i.e. if $X$, then $Y$).
(4) They overgeneralize the references of signs, using one sign for many different things, just as human children do in the early stages.

(5) They don’t use signs spontaneously and only produce them in response to humans.

(6) They have complex concepts such as time because they produce sign combinations such as *time eat*.

(7) They use signs to interact with each other, just as three-year-old children do with speech.

(8) They steadily increase the length of their utterances, so that their average utterance length of 3.0 is equivalent to that of a three-and-a-half-year-old child.

(i) Are these properties found in all forms of human communication via language?

(ii) Are these special properties of human language or can they be found in the communication systems of other creatures?

(For background reading, see chapter 18 of O’Grady et al., 2009.)

II The most persistent criticism of the chimpanzee language-learning projects is that the chimpanzees are simply making responses like trained animals for rewards and are consequently not using language to express anything. Read over the following reports and try to decide how the different behaviors of these chimpanzees (Dar, Washoe and Moja) should be characterized. Signs are represented by words in capital letters.

After her nap, Washoe signed OUT. I was hoping for Washoe to potty herself and did not comply. Then Washoe took my hands and put them together to make OUT and then signed OUT with her own hands to show me how.

Greg was hooting and making other sounds, to prevent Dar from falling asleep. Dar put his fist to Greg’s lips and made kissing sounds. Greg asked WHAT WANT? and Dar replied QUIET, placing the sign on Greg’s lips.
Moja signed DOG on Ron and me and looked at our faces, waiting for us to “woof.” After several rounds I made a “meeow” instead. Moja signed DOG again, I repeated “meeow” again, and Moja slapped my leg harder. This went on. Finally, I woofed and Moja leapt on me and hugged me.

Moja stares longingly at Dairy Queen as we drive by. Then for a minute or more signs NO ICE CREAM many times, by shaking her head while holding fist to mouth, index edge up.

(For background reading, see Rimpau et al., 1989, which is the source of these examples. There is also a film with the title Project Nim (Lionsgate) that describes the unfortunate experiences of the chimpanzee Nim.)

T.S.W. quoted in Mackay (1970)

In Chapter 1, we noted some of the basic features of the human vocal tract and the intricate muscle interlacing in and around the mouth that give humans the ability to produce a wide range of sounds with great speed. Yet, as they chatter away, humans do not simply produce a random selection of these sounds. Only certain sounds are selected on a regular basis as significant for communicative activity. In order to identify and describe those sounds, we have to slow down the chatter of everyday talk and focus on each individual sound segment within the stream of speech. This may seem straightforward, but it is not an easy task.
Phonetics

Fortunately, there is an already established analytic framework for the study of speech segments that has been developed and refined for over a hundred years and is known as the International Phonetic Alphabet, or IPA. In this chapter, we will look at how some of the symbols of this alphabet can be used to represent the sounds of English words and what physical aspects of the human vocal tract are involved in the production of those sounds. The full IPA chart can be found at internationalphoneticalphabet.org.

The general study of the characteristics of speech sounds is called phonetics. Our main interest will be in articulatory phonetics, which is the study of how speech sounds are made, or articulated. Other areas of study are acoustic phonetics, which deals with the physical properties of speech as sound waves in the air, and auditory phonetics (or perceptual phonetics), which deals with the perception, via the ear, of speech sounds.
Consonants

We are not generally aware of how we produce speech sounds and it takes a certain amount of concentration on what we are doing with our mouths to become capable of describing the individual sounds produced. We will begin with the consonants. When we describe the articulation of a consonant, we focus on three features: the voiced/voiceless distinction, the place of articulation and the manner of articulation.
Voiced and Voiceless Sounds

To make a consonant sound, we start with the air pushed out by the lungs up through the trachea (or windpipe) to the larynx. Inside the larynx are your vocal folds (or vocal cords), which take two basic positions.

1 When the vocal folds are spread apart, the air from the lungs passes between them with no obstruction, producing voiceless sounds.

2 When the vocal folds are drawn together, the air from the lungs repeatedly pushes them apart as it passes through, with a vibration effect, producing voiced sounds.

The distinction can be felt physically if you place a fingertip gently on the top of your Adam’s apple (i.e. that part of your larynx you can feel in your neck below your chin), then produce sounds such as Z-Z-Z-Z or V-V-V-V. Because these are voiced sounds, you should be able to feel some vibration. Keeping your fingertip in the same position, now make the sounds S-S-S-S or F-F-F-F. Because these are voiceless sounds, there should be no vibration. Another trick is to put a finger in each ear, not too far, and produce the voiced sounds (e.g. Z-Z-Z-Z) to hear and feel some vibration, whereas no vibration will be heard or felt if you make voiceless sounds (e.g. S-S-S-S) in the same way.
Place of Articulation

Once the air has passed through the larynx, it enters the vocal tract and comes up via the pharynx, an extended tube shape about five inches (13 centimeters) long. It is then pushed out through the mouth (the oral tract) and/or the nose (the nasal tract). As noted in Chapter 1, we typically produce speech as we are breathing out and generally find it quite difficult to do very much talking while breathing in. Most consonant sounds are produced by using the tongue and other parts of the mouth to constrict, in some way, the shape of the oral tract through which the air is passing. The terms used to describe many sounds are those that denote the place of articulation of the sound: that is, the location inside the mouth at which the constriction takes place.

What we need is a slice of head. If we crack a head right down the middle, we will be able to see those parts of the oral cavity that are crucially involved in speech production. In Figure 3.1, in addition to lips and teeth, a number of other physical features are identified. To describe the place of articulation of most consonant sounds, we can start at the front of the mouth and work back. We can also keep the voiced–voiceless distinction in mind and begin using the symbols of the IPA for specific sounds. These symbols will be enclosed within square brackets [ ].
Figure 3.1
Familiar Symbols

Many of the symbols used in phonetics to describe consonant sounds will be familiar. We use [p] for the voiceless consonant in *pop*. We use [b] in *Bob*, [m] in *mom* and [w] in *wet* for the voiced versions. These are **bilabial** consonants, made with both lips.

We use [f] and [v] for the **labiodentals**, which are formed using the upper front teeth and the lower lip at the beginning of *fat* and *vat*. The voiceless [f] is at the beginning and the voiced [v] is at the end of the pronunciation of *five*.

Behind the upper teeth is a rough area called the alveolar ridge. We raise the front of the tongue to this area when we make the **alveolar** sounds of [t] in *tot*, [d] in *dad*, [s], [z] in *size*, [r], [l] in *rail* and [n] in *guy*; [t] and [s] are voiceless, [d], [z], [r], [l] and [n] are voiced.
Unfamiliar Symbols

Other symbols may be much less familiar, as in the two ways of representing the “th” sounds in English. We use [θ], called “theta,” for the voiceless version, as in thin and wrath, and at the beginning and end of the phrase three teeth. We use [ð], called “eth,” for the voiced version, as in thus, then, feather and loathe. Because the teeth are involved in creating these sounds, they are called dentals. If these sounds are made with the tongue tip between (= inter) the teeth, they are described as interdentals.

There are some special symbols used for the sounds made in the middle area of the mouth, involving the tongue and the palate (the roof of the mouth). We use [ʃ] for the “sh” sound, as in shout and shoe-brush, and [ʧ] for the “ch” sound, as in child and church. These are voiceless consonants. Their voiced counterparts are [ʒ] for the sound in treasure and rouge, and [ʤ] for the sound in judge and George. Because they are produced in an area where the alveolar ridge meets the palate, these sounds ([ʃ], [ʧ], [ʒ], [ʤ]) are sometimes described as “post-alveolar” or “palato-alveolar,” but we will just refer to them as palatals. Another palatal is the voiced sound [j], which often represents the sound of the written letter “y,” as in yes, yoyo and lawyer.

The sounds produced toward the back of the mouth, involving the velum, are represented by the velars [k], as in kick (voiceless), and [g], as in gag (voiced). Note that phonetic [g] is different from typewritten “g.” Another velar consonant is [ŋ], called “angma,” as in thong and ringing. There is no [g] sound at the end of these words.

There is one consonant sound produced without the active use of the tongue. It is the [h] sound in have and hold, and the first sound in who and whose. This sound is described as a voiceless glottal. The “glottis” is the space between the vocal folds in the larynx. When the glottis is open, as in the production of other voiceless sounds, and there is no manipulation of the air passing out of the mouth, the sound produced is [h].

A summary of the place of articulation for each consonant is presented in Table 3.1.

Transcribing Sounds (Not Letters)

It is important to remember that written English is often a poor guide to pronunciation. We have already seen that words such as *bang* and *tongue* end with [ŋ] only, and there is no [ɡ] sound despite the spelling. Although they have really different spellings, the first sound in *photo* and the last sound in *enough* are the same [f]. Perhaps more tricky are the final sounds in the pairs *face* versus *phase* and *race* versus *raise*: if you listen carefully, you will hear [s] in the first word of each pair and [z] in the second.
When we focus on the place of articulation for consonants, as in Table 3.1, we can see that [t] and [s] are similar in that they are both voiceless alveolars. But they are clearly different sounds. The difference is in how they are pronounced, or their manner of articulation. The [t] sound is a “stop” consonant and the [s] sound is a “fricative.” An analysis of the manner of articulation of English consonants is presented in Table 3.2. We should note that in some analyses, stops are described as “plosives” and what we call “glides” here may be described as “approximants” or “semi-vowels.”

Glottal Stops and Flaps

Missing from Table 3.3 are two ways of pronouncing consonants that may also be heard in English, usually in casual speech situations. The glottal stop, represented by the symbol [ʔ], is produced when the space between the vocal folds (the glottis) is closed completely very briefly, then released. Many speakers produce a glottal stop in the middle of Uh-uh (meaning “no”), when they say the name Harry Potter as if it didn’t have the “H” or the “tt,” or in the words bottle or butter without the “tt” part.

If, however, you are someone who pronounces the word butter in a way that is close to “budder,” you are making a flap. It is represented by [ɾ]. This sound is produced by the tongue tip tapping the alveolar ridge briefly. Many American English speakers have a tendency to “flap” [t] and [d] consonants between vowels with the result that the pairs latter/ladder, metal/medal and writer/rider do not have distinct middle consonants. Those young students who were told about the importance of Plato in class and wrote it in their notes as playdough were clearly victims of a misinterpreted flap.
Vowels

While the consonant sounds are mostly articulated via obstruction in the vocal tract, vowel sounds are produced with a relatively free flow of air. They are all typically voiced. To describe vowel sounds, we consider the way in which the tongue influences the shape through which the airflow must pass. To talk about a place of articulation, we think of the space inside the mouth as having a front versus a back and a high versus a low area. Thus, in the pronunciation of heat and hit, we talk about “high, front” vowels because the sound is made with the front part of the tongue in a raised position.

In contrast, the vowel sound in hat is produced with the tongue in a lower position and the sound in hot can be described as a “low, back” vowel. The next time you’re facing the bathroom mirror, try saying the words heat, hit, hat, hot. For the first two, your mouth will stay fairly closed, but for the last two, your tongue will move lower and cause your mouth to open wider. (The sounds of relaxation and pleasure typically contain lower vowels.)

We can use a vowel chart, like Table 3.4 (based on Ladefoged and Johnson, 2015), to help classify the most common vowel sounds in English.

Diphthongs

In addition to single vowel sounds, we regularly create sounds that consist of a combination of two vowel sounds, known as diphthongs. When we produce diphthongs, our vocal organs move from one vocalic position [a] to another [I] as we produce the sound [aI], as in Hi or Bye. The movement in this diphthong is from low toward high front. Alternatively, we can use movement from low toward high back, combining [a] and [ʊ] to produce the sound [aʊ], which is the diphthong repeated in the traditional speech training exercise [haʊ naʊ braʊn kaʊ]. In some descriptions, the movement is interpreted as involving a glide such as [j] or [w], so that the diphthongs we are representing as [aI] and [aʊ] may sometimes be seen as [aj] or [aw].

While the vowels [e], [a] and [o] are used as single sounds in other languages, and by speakers of different varieties of English, they are more often used as the first sounds of diphthongs in American English. Figure 3.2 provides a rough idea of how diphthongs are produced and is followed by a list of the sounds, with examples to illustrate some of the variation in the spelling of these sounds.

American and British Diphthongs

The pronunciation of some diphthongs in Southern British English is quite different from North American English, as shown in Table 3.5. Note that the final [r] sound, typically pronounced in American varieties, is often omitted in Southern British English.

Subtle Individual Variation

Vowel sounds are notorious for varying between one variety of English and the next, often being a key element in what we recognize as different accents. It may be, for example, that you make no distinction between the vowels in the words *caught* and *cot* and use [ɑ] in both. You may also be used to seeing the vowel sound of *pet* represented as [ɛ] in dictionaries rather than with [ɛ] as used here. For many speakers, [ɛ] is the short vowel in words like *came* and *make*.

You may not make a significant distinction between the central vowels [ə], called “schwa,” and [ʌ], called “wedge.” If you’re trying to transcribe, just use schwa [ə]. It is the unstressed vowel (underlined) in the everyday use of words such as *afford*, *collapse*, *photograph*, *wanted*, and in those very common words *a* and *thg* in casual speech. You can check the transcription in Task A on page 38 to see how often the schwa sound occurs.

There are many other variations in the physical articulation of speech sounds. We didn’t even mention the *uvula* (“little grape”), hanging at the end of the velum. It is used with the back of the tongue to produce *uvular* sounds, such as the “r” sound, usually represented by [R], in the French pronunciation of *rouge* and *lettre*. The more we focus on the subtle differences in each sound, the more likely we are to find ourselves describing the pronunciation of a group or an individual speaker. Such differences help us to recognize a person’s voice as soon as he or she speaks. But those differences do not explain how we understand what total strangers with unfamiliar voices are saying. We are clearly able to disregard all the variation in the phonetic detail of voices and recognize each underlying sound type as part of a word with a particular meaning. To make sense of how we do that, we need to look at the more general sound patterns, or the phonology, of a language.

Tasks

A The following transcription was made by Peter Ladefoged of a speech sample of “a 21-year-old speaker who has lived all her life in Southern California” and included in the *Handbook of the International Phonetic Association* (1999: 41). Most of the phonetic symbols should be familiar, with the exception of [ɹ], which is close to [r], and [ɚ] which identifies the sound made when combining a schwa [ə] and [r]-type sound, often written in English as “er” or “ir.”

Can you produce a written English version of this text?

B We noted that the relationship between the spelling and pronunciation of English words is not always simple. Keeping this in mind, try to provide a basic phonetic representation of the following words.

- although, beauty, bomb, ceiling, charisma, choice, cough, exercise, hour, light, phase, quiche, quake, sixteen, thigh, tongue, whose, writhe

C Using a dictionary if necessary, try to decide how each of the following words is usually pronounced. Then, put the words in five lists as illustrations of each of the sounds [eɪ], [i], [f], [k] and [ʃ]. Some words will be in more than one list.

- air, belief, critique, crockery, Danish, gauge, giraffe, headache, keys, meat, mission, nation, ocean, pear, people, philosopher, queen, receipt, scene, Sikh, sugar, tough, weight

D We can create a definition for each consonant (e.g. [k]) by using the distinction between voiced and voiceless plus the terms for place (i.e. velar) and manner of articulation (i.e. fricative). So we say that [k] is a voiceless velar fricative. Write similar definitions for the initial sounds in the normal pronunciation of the following words.
Are there any definitions in which the voiced/voiceless distinction is actually unnecessary and could be omitted?

E In some phonetic descriptions, particularly in traditional North American studies, the following four symbols are used: [ʂ], [ʐ], [ č], [ǰ]. The small v-shaped mark, called haček (“little hook”) or caron, indicates some common feature in the pronunciation of these sounds. Based on the following examples, can you work out what that common feature is? What are the four equivalent symbols used in the International Phonetic Alphabet, as illustrated in Table 3.3?

[cɬɪ], [ɭɪn], [tɾɛ̊zɛɾ], [ruž], [čip], [roʊč], [šu], [ʃiš]

F The terms “obstruent” and “sonorant” are sometimes used in descriptions of how consonants are pronounced. Among the types of consonants already described (affricates, fricatives, glides, liquids, nasals, stops), which are obstruents, which are sonorants and why?

G

(i) How would you make a retroflex sound?

(ii) How are retroflex sounds identified in phonetic transcription?

(iii) With which varieties of English are retroflex sounds generally associated?

H What is forensic phonetics?

I When we change the English word secret [sikrət] to secrecy [sikrəsi], the pronunciation of the final consonant changes ([t] > [s]). This type of change is an example of lenition (“softening” or “weakening” from Latin lenis (“soft”)).

(i) Look at the four sets of examples presented here and try to describe the change that takes place in the pronunciation of the final consonant in each set.

(ii) Thinking in terms of manner of articulation, can you provide a general description of the pattern of change found in all four sets?

Discussion Topics/Projects

I When we concentrate on the articulation of sounds, it’s easy to forget that people listening to those sounds often have other clues to help them recognize what we’re saying. In front of a mirror (or enlist a cooperative friend to be the speaker), say the following pairs of words. As you are doing this, can you decide which are rounded or unrounded vowels and which are tense or lax vowels? What clues are you using to help you make your decision?

*bet/bought coat/caught feed/food latel/let mail/mole neat/knit*

(For background reading, see chapter 5 of Ashby and Maidment, 2005.)

II English has a number of expressions such as *chit-chat* and *flip-flop* which never seem to occur in the reverse order (i.e. not *chat-chit* or *flop-flip*). Perhaps you can add examples to the following list of similar expressions.

Bob Belviso, quoted in Espy (1975)

In the preceding chapter, we investigated the physical production of speech sounds in terms of the articulatory mechanisms of the human vocal tract. That investigation was
possible because of some rather amazing facts about the nature of language. When we considered the human vocal tract, we didn’t have to specify whether we were talking about a fairly large person, over 6 feet tall, weighing over 200 pounds, or about a rather small person, about 5 feet tall, weighing less than 100 pounds. Yet those two physically different individuals would inevitably have physically different vocal tracts, in terms of size and shape. In a sense, every individual has a physically different vocal tract. Consequently, in purely physical terms, every individual will pronounce sounds differently. There are, then, potentially millions of physically different ways of saying the simple word *me.*
Phonology

In addition to those millions of different individual vocal tracts, each individual will not pronounce the word *me* in a physically identical manner on every occasion. Obvious differences occur when that individual is shouting, or has just woken from a deep sleep, or is suffering from a bad cold, or is trying to ask for a sixth martini, or any combination of these. Given this vast range of potential differences in the actual physical production of a speech sound, how do we manage consistently to recognize all those versions of *me* as the form [mi], and not [ni] or [si] or [mæ] or [mo] or something else entirely? The answer to that question is provided to a large extent by the study of phonology.

Phonology is essentially the description of the systems and patterns of speech sounds in a language. It is, in effect, based on a theory of what every adult speaker of a language unconsciously knows about the sound patterns of that language. Because of this theoretical status, phonology is concerned with the abstract or mental aspect of the sounds in language rather than with the actual physical articulation of speech sounds. If we can make sense of Bob Belviso’s comic introduction to the Goldilocks story on page 42, we must be using our phonological knowledge of sounds in English words to overcome some very unusual spellings. We can use various different ways of spelling the words in the first and second lines below, but the underlying phonological representation in the third line is constant. (See the end of the chapter for a full translation of the story.)

Uans appona taim uas tri berres
Ones up on atam waz theree bars
/wAns ðpan ð taim wðz ðri berz/

Phonology is about the underlying design, the blueprint of each sound type, which may vary in different physical contexts. When we think of the [t] sound in the words *tar, star, writer, butter* and *eighth* as being “the same,” we actually mean that, in the phonology of English, they would be represented in the same way. In actual speech, these [t] sounds are all potentially very different from each other because they can be pronounced in such different ways in relation to the other sounds around them.

However, all these articulation differences in [t] sounds are less important to us than the distinction between the [t] sounds in general and the [k] sounds, or the [f] sounds, or
the [b] sounds, because there are meaningful consequences related to the use of one rather than the others. These sounds must be distinct meaningful sounds, regardless of which individual vocal tract is being used to pronounce them, because they are what make the words tar, car, far and bar meaningfully distinct. Considered from this point of view, we can see that phonology is concerned with the abstract representation of sounds in our minds that enables us to recognize and interpret the meaning of words on the basis of the actual physical sounds we say and hear.
Phonemes

Each one of these meaning-distinguishing sounds in a language is described as a phoneme. When we learn to use alphabetic writing, we are actually using the concept of the phoneme as the single stable sound type that is represented by a single written symbol. It is in this sense that the phoneme /t/ is described as a sound type, of which all the different spoken versions of [t] are tokens. Note that slash marks are conventionally used to indicate a phoneme, /t/, an abstract segment, as opposed to the square brackets, as in [t], used for each phonetic or physically produced segment.

An essential property of a phoneme is that it functions contrastively. We know there are two phonemes /f/ and /v/ in English because they are the only basis of the contrast in meaning between the words fat and vat, or fine and vine. This contrastive property is the basic operational test for determining the phonemes in a language. If we change one sound in a word and there is a change of meaning, the sounds are distinct phonemes.
Natural Classes

The descriptive terms we used to talk about sounds in Chapter 3 can be considered “features” that distinguish each phoneme from the next. If the feature is present, we mark it with a plus sign (+) and if it is not present, we use a minus sign (−). Thus /p/ can be characterized as [-voice, +bilabial, +stop] and /k/ as [-voice, +velar, +stop]. Because these two sounds share some features, they are sometimes described as members of a natural class of phonemes. Phonemes that have certain features in common tend to behave phonologically in some similar ways. Table 4.1 presents an analysis of some of the distinguishing features of four English phonemes. Only /p/ and /k/ have sufficient features in common to be members of a natural class. They are both voiceless stops.

<table>

</tbody>
</table>

In contrast, /v/ has the features [+voice, +labiodental, +fricative] and so cannot be in the same natural class of sounds as /p/ and /k/. Although other factors will be involved, this feature analysis could lead us to suspect that there may be a good phonological reason why words beginning with /pl-/ and /kl-/ are common in English, but words beginning with /vl-/ or /nl-/ are not. This type of feature analysis allows us to describe not only individual phonemes, but also the possible sequences of phonemes in a language.
Phones and Allophones

While the phoneme is the abstract unit or sound type (“in the mind”), there are many different versions of that sound type regularly produced in actual speech (“in the mouth”). We can describe those different versions as phones, which are phonetic units, in square brackets. When we have a set of phones, all of which are versions of one phoneme, we add the prefix “allo-” (= one of a closely related set) and call them allophones of that phoneme.

For example, the phoneme /t/ can be pronounced in a number of physically different ways as phones. The [t] sound in the word *tar* is normally pronounced with a stronger puff of air than is present in the [t] sound in the word *star*. If you put the back of your hand in front of your mouth as you say *tar*, then *star*, you should feel some physical evidence of aspiration (the puff of air) accompanying the [t] sound at the beginning of *tar* (but not in *star*). This aspirated phone is represented more precisely as [tʰ].

In the last chapter, we noted that the [t] sound between vowels in a word like *writer* often becomes a flap, which we can represent as [ɾ]. That’s another phone.

We also saw that a word like *butter* can have a glottal stop as the middle consonant in the pronunciation, so the part written as “t” may be pronounced as [ʔ], which is yet another phone. In the pronunciation of a word like *eighth* (/eɪθ/), the influence of the final dental [θ] sound causes a dental articulation of the [t] sound. This can be represented more precisely as [t̪]. That’s yet another phone. There are even more variations of this sound which, like [th], [ɾ], [ʔ] and [t̪], can be represented in a more precise way in a detailed, or narrow phonetic transcription. Because these variations are all part of one set of phones, they are referred to as allophones of the phoneme /t/, as shown in Table 4.2.

</tbody>
</table>
The crucial distinction between phonemes and allophones is that substituting one phoneme for another will result in a word with a different meaning (as well as a different pronunciation), but substituting allophones only results in a different (and perhaps unusual) pronunciation of the same word.
Complementary Distribution

When we have two different pronunciations (allophones) of a sound type (phoneme), each used in different places in words, they are said to be in complementary distribution. That is, the [th] pronunciation of the phoneme /t/ with aspiration is used word-initially, as in tar, but never after another consonant in initial position, as in star. The places where /t/ occurs with aspiration, and without aspiration, never overlap and so the different pronunciations are in complementary distribution.
Minimal Pairs and Sets

Phonemic distinctions in a language can be tested via pairs and sets of words. When two words such as *fan* and *van* are identical in form except for a contrast in one phoneme, occurring in the same position, the two words are described as a **minimal pair**. When a group of words can be differentiated, each one from the others, by changing one phoneme (always in the same position in the word), they are described as a **minimal set**. Examples of contrasting pairs and sets are presented in **Table 4.3**.

Phonotactics

This type of exercise with minimal sets also allows us to see that there are definite patterns in the types of sound combinations permitted in a language. The first minimal set in Table 4.3 does not include forms such as lig or vig. According to my dictionary, these are not English words, but they could be viewed as possible English words. That is, our phonological knowledge of the pattern of sounds in English words would allow us to treat these forms as acceptable if, at some future time, they came into use. They might, for example, begin as invented abbreviations (I think Bubba is one very ignorant guy. ~ Yeah, he’s a big vig!). Until then, they represent “accidental” gaps in the vocabulary of English.

It is, however, no accident that forms such as [fsɪɡ] or [rnɪɡ] do not exist or are unlikely ever to exist. They have been formed without obeying some constraints on the sequence or position of English phonemes. Such constraints are called the phonotactics (i.e. permitted arrangements of sounds) in a language and are obviously part of every speaker’s phonological knowledge. Because these constraints operate on a unit that is larger than the single segment or phoneme, we have to move on to a consideration of the basic structure of that larger phonological unit called the syllable.
Syllables

A syllable must contain a vowel or vowel-like sound, including diphthongs. The most common type of syllable also has a consonant (C) before the vowel (V) and is represented as CV. The basic elements of the syllable are the onset (one or more consonants) followed by the rhyme. The rhyme (sometimes written as “rime”) consists of a vowel, which is treated as the nucleus, plus any following consonant(s), described as the coda.

Syllables like me, to or no have an onset and a nucleus, but no coda. They are known as open syllables. When a coda is present, as in the syllables up, cup, at or hat, they are called closed syllables. The basic structure of the kind of syllable found in English words like green (CCVC), eggs (VCC), and (VCC), ham (CVC), I (V), do (CV), not (CVC), like (CVC), them (CVC), Sam (CVC), I (V), am (VC) is shown in Figure 4.1.

Figure 4.1
Consonant Clusters

Both the onset and the coda can consist of more than a single consonant, also known as a consonant cluster. The combination /st/ is a consonant cluster (CC) used as onset in the word stop, and as coda in the word post. There are many CC onset combinations permitted in English phonotactics, as in black, bread, trick, twin, flat and throw. Note that liquids (/l/, /r/) and a glide (/w/) are used in second position.

English can actually have larger onset clusters, as in the words stress and splat, consisting of three initial consonants (CCC). When we study the phonotactics of these larger onset consonant clusters, we can find a fairly regular pattern. The first consonant must always be /s/, followed by one of the natural class of voiceless stops (/p/, /t/, /k/), plus a liquid or a glide (/l/, /r/, /w/). We can check if this description is adequate for the combinations in splash, spring, strong, scream and squeeze (/skwiz/). Does the description also cover the second syllable in the pronunciation of exclaim? How about /ɛk-skleɪm/? Remember that it is the onset of the syllable that is being described, not the beginning of the word. See Task D on page 51 for more syllables and clusters.
Coarticulation Effects

It is quite unusual for languages to have large consonant clusters of the type just described. In English, large clusters may be reduced in casual conversational speech, particularly if they occur in the middle of a word. This is just one example of a process that is usually discussed in terms of coarticulation effects.

In much of the preceding discussion, we have been describing speech sounds in syllables and words as if they are always pronounced carefully in slow motion. Speech is not normally like that. Mostly our talk is fast and spontaneous, and it requires our articulators to move from one sound to the next without stopping. The process of making one sound almost at the same time as the next sound is called coarticulation.
Assimilation

When two sound segments occur in sequence and some aspect of one segment is taken or “copied” by the other, the process is known as assimilation. In the physical production of speech, this regular process happens simply because it is quicker, easier and more efficient for our articulators as they do their job. Think of the word *have* /hæv/ by itself, then think of how it is pronounced in the phrase *I have to go* in everyday speech. In this phrase, as we start to say the /t/ sound in *to*, which is voiceless, we tend to produce a voiceless version of the preceding sound, resulting in what sounds more like /f/ than /v/. So, we typically say [hæftə] in this phrase and you may even see it written informally as “hafta,” showing how the assimilation from a voiced to a voiceless sound is perceived.
Nasalization

Vowels are also subject to assimilation. In isolation, we would typically pronounce [ɪ] and [æ] with no nasal quality at all. However, when we say the words *pin* and *pan* in everyday talk, the anticipation of the final nasal consonant makes it easier to go into the nasalized articulation in advance. This process is known as *nasalization* and can be represented with a small diacritic (\(\sim\)), called “tilde,” over the vowel symbol. The vowel sounds in those words will be, in more precise transcription, [\(\tilde{ɪ}\)] and [\(\tilde{æ}\)]. This process is such a regular feature of English that a phonological rule can be stated in the following way: “Any vowel becomes nasal whenever it immediately precedes a nasal.”

This type of assimilation process occurs in a variety of different contexts. By itself, the word *can* may be pronounced as [kæn], but, when we say *I can go*, the influence of the following velar [\(g\)] in *go* will typically make the preceding nasal sound come out as [\(ŋ\)] (velar) rather than [\(n\)] (alveolar). The most commonly observed conversational version of the phrase is [\(\text{aɪkəŋəʊ}\)]. Notice that the vowel in *can* has also changed to schwa [\(ə\)] from the isolated-word version [\(æ\)]. We may also pronounce *and* as [\(ænd\)] by itself, but in the normal use of the phrase *you and me*, we usually say [\(ən\)], as in [\(juənmi\)].
Elision

In the last example, illustrating the normal pronunciation of you and me, the [d] sound of the word and was not included in the transcription. That is because it is not usually pronounced in this phrase. In the environment of a preceding nasal [n] and a following nasal [m], we simply don’t devote speech energy to including the stop sound [d].

There is also typically no [d] sound included in the everyday pronunciation of a word like friendship [frɛnʃɪp]. This process of not pronouncing a sound segment that might be present in the deliberately careful pronunciation of a word in isolation is described as elision. In consonant clusters, especially in coda position, /lt/ is a common casualty in this process, as in the typical pronunciation [æspɛks] for aspects, or in [himəsbi] for the phrase he must be. We can, of course, slowly and deliberately pronounce each part of the phrase we asked him, but the process of elision (of /kl/) in casual conversation is likely to produce [wiæstəm].

Vowels also disappear through elision, with the result that sometimes a whole syllable may not be pronounced, as in [ɛvri] for every, [ɪntrɪst] for interest, [kæbnət] for cabinet, [kæmərə] for camera, [prɪznər] for prisoner and [spəʊz] for suppose.

These processes are summarized in Table 4.4. We use a pair of symbols (/ ____/) to indicate “in the context of” or “under the influence of” the following element.

Normal Speech

These processes of assimilation, nasalization and elision occur in everyone’s normal speech and should not be regarded as some type of sloppiness or laziness in speaking. In fact, consistently avoiding the regular patterns of assimilation, nasalization and elision used in a language would result in extremely artificial-sounding talk. The point of investigating these phonological processes is not to arrive at a set of rules about how a language should be pronounced, but to try to come to an understanding of the regularities and patterns that underlie the actual use of sounds in language.
Study Questions

1 In French, the words /bo/ for *beau* (“handsome”) and /bõ/ for *bon* (“good”) seem to have different vowels. Are these two vowels allophones or phonemes in French?

2 Which English phoneme has the features: –voice, +velar, +stop?

3 What is an aspirated sound and which of the following words would normally be pronounced with one?

   *kill, pool, skill, spool, stop, tap*

4 Does this phrase (*big black bag*) contain a minimal pair, a minimal set, or neither?

5 Which of the following words would be treated as minimal pairs?

   *ban, fat, pit, bell, tape, heat, meal, more, pat, tap, pen, chain, vote, bet, far, bun, goat, heel, sane, tale, vet*

6 What is meant by the phonotactics of a language?

7 In the pronunciation of *track*, which sound(s) would be the nucleus?

8 What is the difference between an open and a closed syllable?

9 Is the nasal consonant in the everyday pronunciation of *I can go* alveolar or velar?

10 Which segments in the pronunciation of the following words are most likely to be affected by elision?

   (a) *government*  (b) *postman*  (c) *pumpkin*  (d) *sandwich*  (e) *victory*

(i) In the phonology of the Hawaiian language there are only open syllables. Using this information, can you work out how English “Merry Christmas” became “Mele Kalikimaka” for people in Hawai‘i? Also, based on this slender evidence, which two English consonants are probably not phonemes in Hawaiian?

(ii) Including the glottal stop /ʔ/, described in Chapter 3, Hawaiian has eight consonant phonemes. Looking at the list of Hawaiian names below, can you identify the other seven Hawaiian consonants?

(iii) Can you pair each Hawaiian name with its matching English name from the second list (e.g. Henele = Henry)?

E The English words lesson and little are typically pronounced with syllabic consonants.

(i) What exactly is a syllabic consonant and how would it appear in a phonetic transcription?

(ii) Which of these words would most likely be pronounced with a syllabic consonant?

bottle, bottom, button, castle, copper, cotton, paddle, schism, wooden
F We can use the phonology of English as a guide to some regularities in spelling, based on a distinction between shorter vowels and longer vowels (including diphthongs).

(i) Complete Table 4.5 by adding the minimal pairs to appropriate columns to illustrate differences in spelling that match differences in pronunciation here. Can you also add the appropriate phonological forms of the three diphthongs at the top of each column?

(ii) Can you state a general principle connecting spelling to phonology (in these examples)?

back, bake, cock, coke, dame, damn, diner, dinner, dole, doll, hoping, hopping, later, latter, Mick, Mike, mile, mill

(ii) Based on this (rather slim) evidence, would you say that the difference is phonemic or allophonic?
A general distinction can be made among languages depending on their basic rhythm, whether they have syllable-timing or stress-timing. How are these two types of rhythm distinguished and which type characterizes the pronunciation of English, French and Spanish?

The following examples are from Cree, a Native American or Aboriginal language spoken in many areas across Canada. It has been noted that voiced and voiceless stops have different distributions in Cree than in English.

(i) Can you describe the distribution of [p] and [b] by analyzing the places they occur in the following words (from Cowan and Rakušan, 1999)?

(ii) Based on this limited evidence, would you say that [p] and [b] are likely to be phonemes or allophones in Cree?

Discussion Topics/Projects

I We can form negative versions of words such as audible and edible in English by adding in- to produce inaudible and inedible. How would you describe the special phonological processes involved in the pronunciation of the negative versions of the following words?

balance, compatible, complete, decent, glorious, gratitude, legal, literate, mature, perfect, possible, rational, responsible, sane, tolerant, variable

(For background reading, see chapter 3 (pages 75–78) of Payne, 2006.)

II The use of plural -s in English has three different, but very regular, phonological alternatives:

We add /s/ to words like bat, book, cough and ship.

We add /z/ to words like cab, cave, lad, rag and thing.

We add /əz/ or /ɪz/ to words like bus, bush, church, judge and maze.

(i) Can you identify the sets of sounds that regularly precede each of these alternative pronunciations of the plural ending?

(ii) What are the features that each of these sets has in common?

(For background reading, see chapter 2 (pages 55–56) of Jeffries, 2006.)

One attempt to interpret those very unusual spellings might be as follows:

Autocorrect I could do without. It thinks I am stupid and clumsy, and while it’s true that I don’t know how to disable it and I can’t text with thumbs like a teenager (though I am prehensile), why would I let a machine tell me what I want to say? I text someone “Good night” in German, and instead of “Gute Nacht” I send “Cute Nachos.” I type “adverbial,” and it comes out “adrenal,” which is like a knife to my adverbial gland. Invited to dinner, I text my friend to ask whether I can bring anything, and she replies that the “food and dissertation” are under control.

Norris (2015)
The creation of new words in a language never stops and English is one language that is particularly fond of adding to its large vocabulary. Traditionally, we would check in a dictionary to be sure that we were using the right word, with correct spelling, but technological advances have provided us with programs that do the checking for us, or, even more insidiously, as in the situation described by Mary Norris, try to choose the words for us. Unfortunately, at the moment, these programs do not seem to have any way of knowing if the words that are chosen are appropriate or if it is quite normal to send someone a communication out of the blue that reads “cute nachos.” In this chapter, we won’t solve the problem of inappropriate choice of words, but we will look in some detail at how those words came to be part of the language.
Neologisms

Around 1900, in New Berlin, Ohio, a department-store worker named J. Murray Spangler invented a device that he called an electric suction sweeper. This device eventually became very popular and could have become known as a spangler. People could have been spanglering their floors or they might even have spanglered their rugs and curtains. The use could have extended to a type of person who droned on and on (and really sucked), described as spanglerish, or to a whole style of behavior called spanglerism. However, none of that happened. Instead, Mr. Spangler sold his new invention to a local businessman called William H. Hoover, whose Hoover Suction Sweeper Company produced the first machine called a “Hoover.” Not only did the word hoover (without a capital letter) become as familiar as vacuum cleaner all over the world, but in Britain, people still talk about hoovering (and not spanglering) their carpets.

The point of this small tale is that, although we had never heard of Mr. Spangler before, we really had no difficulty coping with the new words: spangler, spanglerish, spanglerism, spanglering or spanglered. That is, we can very quickly understand a new word, a neologism, and accept the use of different forms of that new word in the language. This ability must derive in part from the fact that there is a lot of regularity in the word-formation processes in a language. In this chapter, we will explore some of the basic processes by which new words are created.
Etymology

The study of the origin and history of a word is known as its **etymology**, a term which, like many of our technical words, comes to us through Latin, but has its origins in Greek (étymon “original form” + logia “study of”), and is not to be confused with **entomology**, also from Greek (éntomon “insect”). Greek and Latin are the sources of many English words, often providing alternative ways to describe things, such as **mono-** from Greek (mono-cycle) and **uni-** from Latin (uni-cycle). The other major source, Germanic, provides an alternative form **one-** (one-wheeled cycle).

When we look closely at the etymologies of everyday words, we soon discover that there are many different ways in which new words can enter the language. We should keep in mind that a lot of words in daily use today were, at one time, considered barbaric misuses of the language. It is difficult now to understand the views expressed in the early nineteenth century over the “tasteless innovation” of a word like **handbook**, or the horror expressed by a London newspaper in 1909 over the use of the newly coined word **aviation**. Yet many new words can cause similar outcries as they come into use today. Rather than act as if the language is being debased, we might prefer to view the constant evolution of new words and new uses of old words as a reassuring sign of vitality and creativeness in the way a language is shaped by the needs of its users.
Borrowing

One of the most common sources of new words in English is the process simply labeled **borrowing**, that is, the taking over of words from other languages. (Technically, it’s more than just borrowing, because English doesn’t give them back.) Throughout its history, the English language has adopted a vast number of words from other languages, including these examples:

- **dope** (Dutch)
- **piano** (Italian)
- **tattoo** (Tahitian)
- **jewel** (French)
- **pretzel** (German)
- **tycoon** (Japanese)
- **glitzy** (Yiddish)
- **ski** (Norwegian)
- **yogurt** (Turkish)
- **lilac** (Persian)
- **sofa** (Arabic)
- **zebra** (Bantu)

Sometimes a new sound comes along along with new words. The voiced fricative /ʒ/ became part of English through borrowed French words such as **measure** and **rouge**.

Other languages, of course, borrow terms from English, as in the Japanese use of **suupaa** or **suupaamaaketto** (“supermarket”) and **taipuraitaa** (“typewriter”). We can also hear of people in Finland using a **šekki** (“check”) to pay their bills, Hungarians talking about **sport**, **klub** and **futbal**, or the French discussing problems of **le stress**, over a glass of **le whisky**, during **le weekend**.

In Brazilian Portuguese, the English words **up** and **nerd** have been borrowed and turned into verbs for the new activities **upar** (“to upload”) and **nerdear** (“to surf the internet”). In some cases, the borrowed words are used with quite novel meanings, as in the contemporary German use of the English words **partner** and **look** in the phrase **im Partnerlook** to describe two people who are together and wearing similar clothing. Other German uses of English words are illustrated in Task F on page 66.
A special type of borrowing is described as loan-translation or calque (/kælk/). In this process, there is a direct translation of the elements of a word into the borrowing language. Interesting examples are the French term gratte-ciel, which literally translates as “scrape-sky,” the Dutch wolkenkrabber (“cloud scratcher”) or the German Wolkenkratzer (“cloud scraper”), all of which were calques for the English skyscraper.

The English word superman is thought to be a loan-translation of the German Übermensch, and the term loanword itself is believed to have come from the German Lehnwort. The English expression moment of truth is believed to be a calque from the Spanish phrase el momento de la verdad, though not restricted to the original use as the final thrust of the sword to end a bullfight. Nowadays, some Spanish speakers eat perros calientes (literally “dogs hot”) or hot dogs, which have nothing to do with those four-legged perros. The American concept of “boyfriend” was borrowed, with sound change, into Japanese as boyifurendo, but as a calque into Chinese as “male friend” or nan pengyu.
Compounding

In some of the examples we have just considered, there is a joining of two separate words to produce a single form. Thus, Lehn and Wort are combined to produce Lehnwort in German. This combining process, technically known as compounding, is very common in languages such as German and English, but much less common in languages such as French and Spanish. Common English compounds are bookcase, doorknob, fingerprint, sunburn, textbook, wallpaper, wastebasket and waterbed. All these examples are nouns, but we can also create compound adjectives (good-looking, low-paid) and compounds of adjective (fast) plus noun (food) as in a fast-food restaurant or a full-time job.

This very productive source of new terms has been well documented in English and German, but can also be found in totally unrelated languages, such as Hmong (spoken in Laos and Vietnam), which has many recently created compounds. (More examples can be found in Task I, on page 68.)

\end{align*}
\]
Blending

The combination of two separate forms to produce a single new term is also present in the process called blending. However, in blending, we typically take only the beginning of one word and join it to the end of the other word. To talk about the combined effects of smoke and fog, we can use the word smog. In places where they have a lot of this stuff, they can jokingly make a distinction between smog, smaze (smoke + haze) and smurk (smoke + murk). In Hawai‘i, near the active volcano, they have problems with vog. Some common examples of blending are bit (binary/digit), brunch (breakfast/lunch), motel (motor/hotel), telecast (television/broadcast), Oxbridge (Oxford/Cambridge) for both universities considered together and the Chunnel (Channel/tunnel) connecting England and France.

The activity of fund-raising on television that feels like a marathon is typically called a telethon, while infotainment (information/entertainment) and simulcast (simultaneous/broadcast) are other new blends from life with television. To describe the mixing of languages, some people talk about Franglais (Français/Anglais) and Spanglish (Spanish/English). In a few blends, we combine the beginnings of both words, as in terms from information technology, such as telex (teleprinter/exchange) or modem (modulator/demodulator). A blend from the beginnings of two French words velours croché (“hooked velvet”) is the source of the word velcro. How about the word fax? Is that a blend? No, see next category.
Clipping

The element of reduction that is noticeable in blending is even more apparent in the process described as clipping. This occurs when a word of more than one syllable (facsimile) is reduced to a shorter form (fax), usually beginning in casual speech. The term gasoline is still used, but most people talk about gas, using the clipped form. Other common examples are ad (advertisement), bra (brassiere), cab (cabriolet), condo (condominium), fan (fanatic), flu (influenza), perm (permanent wave), phone, plane, porn and pub (public house). English speakers also like to clip each other’s names, as in Al, Ed, Liz, Mike, Ron, Sam, Sue and Tom. There must be something about educational environments that encourages clipping because so many words get reduced, as in chem, exam, gym, lab, math, phys-ed, poly-sci, prof and typo.
Hypocorisms

A particular type of reduction, favored in Australian and British English, produces forms technically known as hypocorisms. In this process, a longer word is reduced to a single syllable, then -y or -ie is added to the end. This is the process that results in movie (“moving pictures”) and telly (“television”). It has also produced Aussie (“Australian”), barbie (“barbecue”), bickie (“biscuit”), bookie (“bookmaker”), brekky (“breakfast”), bankie (“handkerchief”) and toastie (“toasted sandwich”). You can probably guess what Chrissy pressies are. By now, you may be ready to take a sickie (“a day of sick leave from work, whether for real sickness or not”).
Backformation

A very specialized type of reduction process is known as backformation. Typically, a word of one type (usually a noun) is reduced to form a word of another type (usually a verb). A good example of backformation is the process whereby the noun television first came into use and then the verb televise was created from it. Other examples of words created by this process are: donate (from “donation”), emote (from “emotion”), enthuse (from “enthusiasm”) and liaise (from “liaison”). Indeed, when we use the verb backform (Did you know that “opt” was backformed from “option”?), we are using a backformation. Here are some other recent creations.

</tr>
</thead>
<tbody>
<tr>
<td>choreography → choreograph</td>
<td>mixture → mix</td>
</tr>
<tr>
<td>syllabification → syllabify</td>
<td>orientation → orientate → orient</td>
</tr>
</tbody>
</table>

One very regular source of backformed verbs in English is based on the common pattern work – worker. The assumption seems to have been that if there is a noun ending in -er (or something close in sound), then we can create a verb for what that noun-er does. Hence, an editor will edit, a sculptor will sculpt and babysitters, beggars, burglars, peddlers and swindlers will babysit, beg, burgle, peddle and swindle.
Conversion

A change in the function of a word, as for example when a noun comes to be used as a verb (without any reduction), is generally known as conversion. Other labels for this very common process are “category change” and “functional shift.” A number of nouns such as bottle, butter, chair and vacation have come to be used, through conversion, as verbs: We bottled the home-brew last night; Have you buttered the toast?; Someone has to chair the meeting; They’re vacationing in Florida. These forms are readily accepted, but some conversions, such as the noun impact used as a verb, seem to impact some people’s sensibilities rather negatively.

The conversion process is very productive in Modern English, with new uses occurring frequently. The conversion can involve verbs becoming nouns, with guess, must and spy as the sources of a guess, a must and a spy. Phrasal verbs (to print out, to take over) also become nouns (a printout, a takeover). One complex verb combination (want to be) has become a new noun, as in He isn’t in the group, he’s just a wannabe. Some other examples of conversion are listed here.

<table>

</tr>

</tr>
<tr>

</tr>
</tbody>
</table>

Verbs (see through, stand up) can also become adjectives, as in see-through material or a stand-up comedian. A number of adjectives, as in a dirty floor, an empty room, some crazy ideas and those nasty people, have become the verbs to dirty and to empty, or the nouns a crazy and the nasty.

Some compound nouns have assumed other functions, exemplified by the ball park appearing in a ball-park figure (as an adjective) or asking someone to ball-park an estimate of the cost (as a verb). Other nouns of this type are carpool, mastermind, microwave and quarterback, which are also used as verbs now. Other forms, such as up and down, can also
become verbs, as in *They’re going to up the price of oil* or *We downed a few beers at the Chimes*.

It is worth noting that some words can shift substantially in meaning when they go through conversion. The verb *to doctor* often has a negative sense, not normally associated with the source noun *a doctor*. A similar kind of reanalysis of meaning is taking place with the noun *total* and the verb *run around*, which do not have negative meanings. However, if you *total* (= verb) your car, and your insurance company gives you the *runaround* (= noun), you will have a double sense of the negative.
Coinage

The invention and general use of totally new terms, or coinage, is not very common in English. Typical sources are trade names for commercial products that become general terms (usually without capital letters) for any version of that product. Older examples are aspirin, nylon, vaseline and zipper; more recent examples are granola, kleenex, teflon and xerox. It may be that there is an obscure technical origin (e.g. te (tra)-fl(uor)-on) for some of these invented terms, but after their first coinage, they tend to become everyday words in the language. The most salient contemporary example of coinage is the word google. Originally a misspelling for the word googol (= the number 1 followed by 100 zeros), in the creation of the word Googleplex, which later became the name of a company (Google), the term google (without a capital letter) has since undergone conversion from a noun to become a widely used verb meaning “to use the internet to find information.”

New words based on the name of a person or a place are called eponyms. When we talked about a hoover (or even a spangler), we were using an eponym. We use the eponyms teddy bear, derived from US president Theodore (Teddy) Roosevelt, and jeans (from the Italian city of Genoa where the type of cloth was first made). Another eponym dates from 1762 when John Montagu, the fourth Earl of Sandwich, insisted on having his salt beef between two slices of toasted bread while gambling. Apparently his friends started to ask “to have the same as Sandwich.”
Acronyms

Acronyms are new words formed from the initial letters of a set of other words. These can be forms such as CD (“compact disk”) or SPCA (“Society for the Prevention of Cruelty to Animals”) where the pronunciation consists of saying each separate letter. More typically, acronyms are pronounced as new single words, as in NATO, NASA or UNESCO. These examples have kept their capital letters, but many acronyms simply become everyday terms such as laser (“light amplification by stimulated emission of radiation”), radar (“radio detecting and ranging”), scuba (“self-contained underwater breathing apparatus”), a sim (“subscriber identity module”) card and zip (“zone improvement plan”) code. You might even hear talk of a snafu, which is reputed to have its origins in “situation normal, all fouled up,” though there is some dispute about the appropriate verb in there.

Names for organizations are often designed to have their acronym represent an appropriate term, as in “mothers against drunk driving” (MADD) and “women against rape” (WAR). Many speakers do not think of their component meanings. Innovations such as the ATM (“automatic teller machine”) and the required PIN (“personal identification number”) are regularly used with one of their elements repeated, as in I sometimes forget my PIN number when I go to the ATM machine. The ATM example is also known as an “initialism” (see Task A, page 65).
Derivation

In our list so far, we have not dealt with what is by far the most common word-formation process to be found in the production of new words. This process is called derivation and it is accomplished by means of a large number of small “bits” of the English language that are not usually given separate listings in dictionaries. These small “bits” are generally described as affixes. Some familiar examples are the elements un-, mis-, pre-, -ful, -less, -ish, -ism and -ness which appear in words like unhappy, misrepresent, prejudge, joyful, careless, boyish, terrorism and sadness.
Prefixes and Suffixes

Looking more closely at the preceding group of words, we can see that some affixes are added to the beginning of the word (e.g. *un*-, *mis*-). These are called prefixes. Other affixes are added to the end of the word (e.g. *-less*, *-ish*) and are called suffixes. All English words formed by this derivational process have either prefixes or suffixes, or both. Thus, *mishand* has a prefix, *disrespectful* has both a prefix and a suffix, and *foolishness* has two suffixes.

According to Dixon (2014: 11), English has about 200 derivational affixes, divided into 90 prefixes and 110 suffixes. We will investigate the range of English affixes in more detail in Chapter 6.
Infixes

There is a third type of affix, not normally used in English, but found in some other languages. This is called an *infix*, which is an affix that is incorporated inside another word. It is possible to see the general principle at work in certain expressions, occasionally used in fortuitous or aggravating circumstances by emotionally aroused English speakers: *HalleluLuhlah!*, *Absogoddlutely!* and *Unfuckinbelievable!*. We could view these “inserted” forms as a special version of infixing in English. However, a much better set of examples can be provided from Khmu (or Kamhmu), a language spoken in northern Laos and Vietnam.

<table>
<thead>
<tr>
<th>Verb</th>
<th>Noun</th>
</tr>
</thead>
<tbody>
<tr>
<td>(“to drill”)</td>
<td><em>see</em> srnee</td>
</tr>
<tr>
<td>(“to chisel”)</td>
<td><em>tob</em> trnob</td>
</tr>
<tr>
<td>(“to eat with a spoon”)</td>
<td><em>hiip</em> hriip</td>
</tr>
<tr>
<td>(“to tie”)</td>
<td><em>boom</em> hrroom</td>
</tr>
</tbody>
</table>

From these examples, we can see that there is a regular pattern whereby the infix *-rn-* is added to verbs to form nouns. If we know that the form *srnal* is the Khmu noun for “an ear ornament,” then we can work out the corresponding verb “to put an ornament in the ear.”

According to Merrifield *et al.* (2003), the source of these examples, it is *sal*.

For examples of another type of affix called a “circumfix,” see Task G, on page 67.
Multiple Processes

Although we have concentrated on each of these word-formation processes in isolation, it is possible to trace the operation of more than one process at work in the creation of a particular word. For example, the term *deli* seems to have become a common American English expression via a process of first borrowing *delicatessen* (from German) and then clipping that borrowed form. If someone says that *problems with the project have snowballed*, the final word can be analyzed as an example of compounding in which *snow* and *ball* were combined to form the noun *snowball*, which was then turned into a verb through conversion. Forms that begin as acronyms can also go through other processes, as in the use of *lase* as a verb, the result of backformation from *laser*. In the expression *waspish attitudes*, the acronym *WASP* (“white Anglo-Saxon Protestant”) has lost its capital letters and gained a suffix (*-ish*) in the derivation process.

An acronym that never seems to have had capital letters comes from “young urban professional,” plus the *-ie* suffix, as in hypocorism, to produce the word *yuppie* (first recorded in 1984). The formation of this new word, however, was helped by a quite different process, known simply as analogy, whereby new words are formed that are similar in some way to existing words. *Yuppie* was made possible as a new word by analogy with the earlier word *hippie* and another short-lived analogy *yippie*. The word *yippie* also had an acronym basis (“youth international party”) and was used for some students in the USA who were protesting against the war in Vietnam. One joke has it that *yippies* just grew up to be *yuppies*. And the process continues. Another analogy, with the word *yap* (“to make shrill noises”), helped label some of the noisy young professionals as *yappies*.

Many of these new words can, of course, have a very brief life-span. Perhaps the generally accepted test of the “arrival” of recently formed words in a language is their published appearance in a dictionary. In recent years, we have added *app* (from “application”) and *vape* (from “vaporizer”), both via clipping, *blog* (from “web log”) and *sexting* (“sexual texting”) via blending, and *unfriend* and *mint* (= “cool”) via conversion. Further examples are included in Task E, on page 66.

However, new additions can sometimes lead to protests from some conservative voices, as Noah Webster found when his first dictionary, published in 1806, was criticized for citing words like *advocate* and *test* as verbs, and for including such “vulgar” words as
advisory and presidential. It would seem that Noah had a keener sense than his critics of which new word forms in the language were going to last.
Study Questions

1 When is an eponym a neologism?

2 Which word-formation process is the source of the English word *modem*?

3 Which two processes were involved in the creation of the verb *google*, as in *Have you ever googled yourself*?

4 Which process is clearly involved in creating the new term *selfie*?

5 What do we call the process whereby a new word is formed to be similar to an existing word?

6 Which of the following pairs contains an example of calque? How would you describe the other(s)?
   (a) *footbooru* (Japanese) – *football* (English)
   (b) *tréning* (Hungarian) – *training* (English)
   (c) *luna de miel* (Spanish “moon of honey”) – *honeymoon* (English)
   (d) *jardin d’enfants* (French “garden of children”) – *Kindergarten* (German “children garden”)

7 Can you identify the different word-formation processes involved in producing each of the underlined words in these sentences?
   (a) *Don’t they ever worry that they might get AIDS?*
   (b) *That’s really *fandamntastic*!*
   (c) *These new *skateboards* from Zee Designs are *kickass*.*
   (d) *When I’m ill, I want to see a *doc*, not a *vet*.*
   (e) *The house next door was *burgled* when I was *babysitting* the Smiths’ children.*
   (f) *I like this old *sofa* – it’s nice and *comfy*.*
   (g) *I think Robyn said she’d like a *toastie* for *brekky*.*
   (h) *You don’t need to *button* it because it’s got *velcro* inside."

8 Identify the prefixes and suffixes used in these words:
9 In Khmu, the word *kap* means “to grasp with tongs,” and *tiap* means “to fold a small package.” What would be the words for “tongs” and “a small package”?  

10 More than one process was involved in the creation of the forms underlined in these sentences. Can you identify the processes involved in each case?

(a) *Can you FedEx the books to me today?*

(b) *Police have reported an increase in carjackings in recent months.*

(c) *Jeeves, could you tell the maid to be sure to hoover the bedroom carpet?*

(d) *I had to temp for a while before I got a real job.*

(e) *Is your friend Ian still blogging?*

(f) *Would you prefer a decaf?*

Discussion Topics/Projects

I When we form compounds in English, how do we know whether to join the words (hairspray), join them with a hyphen (hair-spray) or leave a space between them (hair spray)? Using the examples below, and any others that you want to include in the discussion, try to decide if there are any typical patterns in the way we form compounds.

backpack, back-pedal, back seat, blackboard, black hole, black-tie affair, bulletin board, double bed, double-cross, house husband, house-warming, housewife, life-saving, lifestyle, life insurance, mother-in-law, mother tongue, postcard, Post-its, post office, workbook, work experience, work-to-rule

(For background reading, see chapter 3 of Denning, Kessler and Leben, 2007.)

II The sign in Figure 5.1 contains a word (flushable) that you may not have seen before. But it isn’t hard to understand. However, when we derive new words with a suffix such as -able, there seems to be some type of constraint on what is permitted. The words in the left column below are “acceptable” (that’s one!), but the forms in the other two columns don’t seem to be current English words. They are marked with an asterisk * to show that we think they are “unacceptable” (there’s another one!). From these examples, and any others that you think might be relevant to the discussion, can you work out what the rule(s) might be for making new adjectives with the suffix -able?

BAMBIFICATION: The mental conversion of flesh and blood living creatures into cartoon characters possessing bourgeois Judeo-Christian attitudes and morals.

Coupland (1991)

Throughout Chapter 5, we approached the description of processes involved in word formation as if the unit called the “word” was always a regular and easily identifiable form, even when it is a form such as bambification that we may never have seen before. This doesn’t seem unreasonable when we look at a text of written English, since the “words” in the text are, quite obviously, those sets of things marked in black with the
bigger spaces separating them. Unfortunately, there are a number of problems with using this observation as the basis of an attempt to describe language in general, and individual linguistic forms in particular.
Morphology

In many languages, what appear to be single forms actually turn out to contain a large number of “word-like” elements. For example, in Swahili (or Kiswahili, spoken throughout East Africa), the form _nitakupenda_ conveys what, in English, would have to be represented as something like _I will love you_. Now, is the Swahili form a single word? If it is a “word,” then it seems to consist of a number of elements that, in English, turn up as separate “words.” A rough correspondence can be presented here:

| ni- | ta- | ku- | penda |
| I   | will | you | love  |

It would seem that this Swahili “word” is rather different from what we think of as an English “word.” Yet there clearly is some similarity between the languages, in that similar elements of the whole message can be found in both. Perhaps a better way of looking at linguistic forms in different languages would be to use this notion of “elements” in the message, rather than depend on identifying only “words.”

The type of exercise we have just performed is an example of investigating basic forms in language, known as morphology. This term, which literally means “the study of forms,” was originally used in biology, but since the middle of the nineteenth century has also been used to describe the study of all those basic “elements” used in a language. What we have been describing as “elements” in the form of a linguistic message are technically known as “morphemes.”
Morphemes

We do not actually have to go to other languages such as Swahili to discover that “word forms” may consist of a number of elements. We can recognize that English word forms such as talks, talker, talked and talking must consist of one element talk, and the other four elements -s, -er, -ed and -ing. All these elements are described as morphemes. The definition of a morpheme is “a minimal unit of meaning or grammatical function.” Units of grammatical function include forms used to indicate past tense or plural, for example. So, we can take words apart, as shown in Table 6.1 with re-new-ed and tour-ist-s, to reveal the different elements in their morphology.

Table 6.1

</tbody>
</table>
Free and Bound Morphemes

Looking at the examples in Table 6.1, we can make a broad distinction between two types of morphemes. There are free morphemes, that is, morphemes that can stand by themselves as single words, for example, *new* and *tour*. There are also bound morphemes, which are those forms that cannot normally stand alone and are typically attached to another form, exemplified as *re-*,-*ist*, -*ed*, -*s*. These forms were described in Chapter 5 as affixes. So, we can say that all affixes (prefixes and suffixes) in English are bound morphemes. The free morphemes can generally be identified as the set of separate English word forms such as basic nouns, verbs, adjectives and adverbs. When they are used with bound morphemes attached, the basic word forms are technically known as stems. For example:

<table>
<thead>
<tr>
<th>undressed</th>
<th>carelessness</th>
</tr>
</thead>
<tbody>
<tr>
<td>un-</td>
<td>-ed</td>
</tr>
<tr>
<td>prefix</td>
<td>stem</td>
</tr>
<tr>

<td>(free)</td>
</tr>
<tr>
<td>dress</td>
<td>-less</td>
</tr>
<tr>
<td>(free)</td>
<td>suffix</td>
</tr>
<tr>
<td>-ed</td>
<td>-ness</td>
</tr>
</tbody>
</table>

We should note that this type of description is a partial simplification of the morphological facts of English. There are a number of English words, typically derived from Latin, in which the element treated as the stem is not a free morpheme. In words such as *receive*, *reduce* and *repeat*, we can identify the bound morpheme *re-* at the beginning, but the elements -*ceive*, -*duce* and -*peat* are not separate word forms in English and hence cannot be free morphemes. These types of forms are sometimes described as “bound stems.”
Lexical and Functional Morphemes

What we have described as free morphemes fall into two categories. The first category is that set of ordinary nouns (*girl, house*), verbs (*break, sit*), adjectives (*long, sad*) and adverbs (*never, quickly*) that we think of as the words that carry the “content” of the messages we convey. These free forms are called lexical morphemes. We can add new lexical morphemes to the language rather easily, so they are treated as an “open” class of words.

Other types of free morphemes are called functional morphemes. Examples are articles (*a, the*), conjunctions (*and, because*), prepositions (*on, near*) and pronouns (*it, me*). Because we almost never add new functional morphemes to the language, they are described as a “closed” class of words.
Derivational Morphemes

The set of affixes that make up the category of bound morphemes can also be divided into two types. One type is described in Chapter 5 in terms of the derivation of words. These are derivational morphemes. We use these bound forms to make new words or to make words of a different grammatical category from the stem. For example, the addition of the derivational morpheme -ment changes the verb encourage to the noun encouragement. The noun class can become the verb classify by the addition of the derivational morpheme -ify. Derivational morphemes can be suffixes like -ment and -ify and also prefixes, such as re-, pre-, ex-, mis-, co-, un-.
Inflectional Morphemes

The second set of bound morphemes contains inflectional morphemes (or “inflections”). These are not used to produce new words in the language, but rather to indicate the grammatical function of a word. Inflectional morphemes are used to show if a word is plural or singular, past tense or not, and if it is a comparative or possessive form. English has only eight inflectional morphemes, all suffixes.

*Jim’s two sisters are really different.*

*One likes to have fun and is always laughing.*

*The other enjoyed school as a child and has always been very serious.*

*One is the loudest person in the house and the other is quieter than a mouse.*

In the first sentence, both inflections are attached to nouns, marking possessive (-’s) and plural (-s). There are four inflections attached to verbs: -s (3rd person singular, present tense), -ing (present participle), -ed (past tense) and -en (past participle). Two inflections attach to adjectives: -er (comparative) and -est (superlative).

There is some variation in the form of these inflectional morphemes. For example, the possessive sometimes appears as a plural form –s’ (those boys’ bags) and the past participle is often -ed (they have talked already). Table 6.2 has a summary.

Morphological Description

The difference between derivational and inflectional morphemes is worth emphasizing. An inflectional morpheme never changes the grammatical category of a word. For example, both *old* and *older* are adjectives. The *-er* inflection here (from Old English *-ra*) simply creates a different version of the adjective. However, a derivational morpheme can change the grammatical category of a word. The verb *teach* becomes the noun *teacher* if we add the derivational morpheme *-er* (from Old English *-ere*). So, the suffix *-er* in Modern English can be an inflectional morpheme as part of an adjective and also a distinct derivational morpheme as part of a noun. Just because they look the same (*-er*) doesn’t mean they do the same kind of work.

Whenever there is a derivational suffix and an inflectional suffix used together, they always appear in that order. First the derivational (*-er*) is attached to *teach*, then the inflectional (*-s*) is added to produce *teachers*. Armed with all these terms for different types of morphemes, we can now take most sentences of English apart and list all the “elements.” For example, in the sentence *The teacher’s wildness shocked the girls’ parents*, we can identify thirteen morphemes.

A useful way to remember all these different types of morphemes is presented in Figure 6.1.

Morphs, Allomorphs and Special Cases

The rather neat chart presented in Figure 6.1 conceals a number of outstanding problems in the analysis of English morphology. The inflectional morpheme -s is added to cat and we get the plural cats. What is the inflectional morpheme that makes sheep the plural of sheep, or men the plural of man? These two words are clearly exceptions to the general pattern and have to be treated as special cases.

One way to describe more regular differences in inflectional morphemes is by proposing variation in morphological realization rules. In order to do this, we draw an analogy with processes already noted in phonology (Chapter 4, page 45). Just as we treated phones as the actual phonetic realization of phonemes, so we can propose morphs as the actual forms used to realize morphemes. For example, the form cats consists of two parts, /kæt/ + /-s/, with a lexical morpheme (“cat”) and an inflectional morpheme (“plural”). The words dogs and horses also consist of two parts, /dɔɡ/ + /-z/ and /hɔrəs/ + /-əz/, each consisting of a lexical morpheme and an inflectional morpheme (“plural”). So we have at least three forms (/-s/, /-z/ and /-əz/) used to realize the inflectional morpheme “plural.” Just as we noted that there were “allophones” of a phoneme, so we can recognize the existence of allomorphs of a morpheme, again using the prefix “allo-“ (= one of a closely related set). The three allomorphs of the one morpheme (“plural”) are shown in Table 6.3.

Table 6.3

<table>
<thead>
<tr>
<th>Morpheme</th>
<th>Allomorphs</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>/-s/</td>
</tr>
<tr>
<td>plural</td>
<td>/-z/</td>
</tr>
<tr>
<td></td>
<td>/-əz/</td>
</tr>
</tbody>
</table>

Returning to our special cases, we could propose that there may be a “zero-morph” involved when we add the “plural” morpheme to a word like sheep, so that the plural of sheep can be analyzed as /ʃip/ + /ə/, adding another form (/ə/) to the set of allomorphs of “plural.” When we add “plural” to /mæn/, we could have a vowel change in the word (æ → ɛ) as the morph that produces the “irregular” plural form men. However, it is more likely that we treat the two forms /mæn/ and /mɛn/ as two distinct lexical morphemes.
There is a similar pattern in the way “past tense” is realized in English. The inflectional suffix \textit{-ed} is used in the typical derivation: \textit{flirted}, \textit{hugged} and \textit{kissed}. The irregular forms are like separate lexical morphemes: \textit{go/went}, \textit{be/was/were}. See Task C, on page 81, for more on the allomorphs of past tense in English.
Other languages

When we look at the morphology of other languages, we can find other forms and patterns realizing the basic types of morphemes we have identified. In the following examples, based on Gleason (1955), we can try to work out how different forms in the languages are used to realize morphological processes and features.
Kanuri

This first set of examples is from Kanuri, a language spoken in Nigeria.

<table>
<thead>
<tr>
<th>Adjective</th>
<th>Noun</th>
<th>(optional morpheme)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(“excellent”)</td>
<td>karite</td>
<td>nəmkarite</td>
</tr>
<tr>
<td>(“big”)</td>
<td>kura</td>
<td>nəmkura</td>
</tr>
<tr>
<td>(“small”)</td>
<td>gana</td>
<td>nəmgana</td>
</tr>
<tr>
<td>(“bad”)</td>
<td>dibi</td>
<td>nəmdibi</td>
</tr>
</tbody>
</table>

From this set, we can propose that nəm- is a prefix, functioning as a derivational morpheme that is used to derive nouns from adjectives. The process is similar to the use of the suffix -ness in English, creating the noun bigness from the adjective big. Discovering a regular morphological feature of this type helps us to make certain predictions when we encounter other forms. For example, if the Kanuri word for “length” is nəmkurugu, then we can be reasonably sure that “long” is kurugu.
Ganda

Different languages also employ different means to produce inflectional marking on forms. Here are some examples from Ganda, a language spoken in Uganda.

<table>
<thead>
<tr>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&quot;doctor&quot;)</td>
<td>omusawo</td>
</tr>
<tr>
<td>(&quot;woman&quot;)</td>
<td>omukazi</td>
</tr>
<tr>
<td>(&quot;girl&quot;)</td>
<td>omuwala</td>
</tr>
<tr>
<td>(&quot;heir&quot;)</td>
<td>omusika</td>
</tr>
</tbody>
</table>

From this small sample, we can observe that there is an inflectional prefix *omu-* used with singular nouns, and a different inflectional prefix *aba-* used with the plural of those nouns. If we learn that *abalenzi* is a Ganda plural, meaning “boys,” then we can be pretty sure that the singular form meaning “boy” must be *omulenzi*. 
Ilocano

When we look at Ilocano, a language of the Philippines, we find a quite different way of marking plurals.

<table>
<thead>
<tr>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>úlo</td>
<td>ulúlo</td>
</tr>
<tr>
<td>délan</td>
<td>daldálan</td>
</tr>
<tr>
<td>bíag</td>
<td>bibiéag</td>
</tr>
<tr>
<td>múla</td>
<td>mulmúla</td>
</tr>
</tbody>
</table>

In these examples, there seems to be repetition of the first part of the singular form. When the first part is *bí-* in the singular, the plural begins with this form repeated *bibí-*. The process involved here is technically known as reduplication (= “repeating all or part of a form”). Having seen how plurals differ from singular forms in Ilocano, you should be able to take this plural form *taltálom* (“fields”) and work out what the singular (“field”) would be. If you follow the observed pattern, you should get *tálon*. 
Tagalog

Here are some examples from Tagalog, another language of the Philippines.

<table>
<thead>
<tr>
<th>Basa (“read”)</th>
<th>Tawag (“call”)</th>
<th>Sulat (“write”)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bumasa (“Read!”)</td>
<td>Tumawag (“Call!”)</td>
<td>Sumulat (“Write!”)</td>
</tr>
<tr>
<td>Babasa (“will read”)</td>
<td>Tatawag (“will call”)</td>
<td>Susulat (“will write”)</td>
</tr>
</tbody>
</table>

If we assume that the first form in each column can be treated as a stem, then it appears that, in the second item in each column, an element -um- has been inserted after the first consonant, or more precisely, after the syllable onset. It is an example of an infix (described in Chapter 5, page 62).

In the third example in each column, the change involves a repetition of the first syllable, as basa becomes babasa. So, referring to the future in Tagalog is done via reduplication. Using this information, we can complete these examples:

<table>
<thead>
<tr>
<th>Lakad (“walk”)</th>
<th>(“Walk!”)</th>
<th>(“will walk”)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lapit (“come here”)</td>
<td>(“Come here!”)</td>
<td>(“will come here”)</td>
</tr>
</tbody>
</table>

In the second column, with the infix -um-, we would write lumakad and lumapit. In the third column, with reduplication, we would write lalakad and lalapit. So, next time you’re enjoying a stroll through the streets of Manila and you hear lumapit!, you’ll know what to do. Learn more about Tagalog in Task D, on page 82.
Study Questions

1. How many morphemes are there in the word terrorists?

2. What kind of morpheme is the suffix in slowly?

3. What are the functional morphemes in the following sentence? When she walked into the room, the doctor asked me if I had a sore throat or an annoying cough.

4. (i) List the bound morphemes in these words: fearlessly, happier, misleads, previewer, shortening, unreconstructed

(ii) Which of these words has a bound stem: consist, deceive, introduce, repeat?

(iii) Which of these words contains an allomorph of the morpheme “past tense”: are, have, must, sitting, waits?

5. (i) Which word(s) in the following sentence would you put in a closed class?

Bob brought hot donuts to class.

(ii) Which word(s) in the following sentence would you put in an open class? I put it on the shelf near you and him.

6. How many regular inflectional morphemes are there in English?

7. What are the inflectional morphemes in these expressions?

(a) Have you eaten yet?

(b) Do you know how long I’ve been waiting?

(c) She’s younger than me and always dresses in the latest style.

(d) We looked through my grandmother’s old photo albums.

(e) My parents’ parents were all from Scotland.

8. What are the allomorphs of the morpheme “plural” in the following set of English words?

criteria, dogs, oxen, deer, judges, stimuli
9 In Indonesian, the singular form translating “child” is *anak* and the plural form (“children”) is *anakanak*. What is the technical term used to describe this relationship?

Discussion Topics/Projects

I In English, plural forms such as mice appear to be treated in a different way from plurals such as rats. If you tell people that a place is infested with mice or rats, they will accept the compounds mice-infested and rat-infested, but not rats-infested. This would suggest that the forms with the regular plural affix (-s) follow a different rule in compounding than irregular plural forms such as mice. Can you think of a way to state a rule (or sequence of rules) that would accommodate all the examples given here? (The asterisk * designates an unacceptable form.)

| teethmarks | the feet-crumcher | lice-infested | a people-mover |
| clawmarks  | the finger-crumcher | roach-infested | a dog-mover |
| *clawsmarks | *the fingers-crumcher | *roach-infested | *a dogs-mover |

Diagramming sentences is one of those lost skills, like darning socks or playing the sackbut, that no one seems to miss. When it was introduced in an 1877 text called *Higher Lessons in English* by Alonzo Reed and Brainerd Kellogg, it swept through American public schools like measles, embraced by teachers as the way to reform students who were engaged in (to take Henry Higgins slightly out of context) “the cold-blooded murder of the English tongue.”

Florey (2006)

We have already looked at two levels of description used in the study of language. We have described linguistic expressions as sequences of sounds that can be represented in...
the phonetic alphabet and described in terms of their features. That is, we can identify a voiced fricative /ð/, a voiceless stop /k/ and a diphthong /ɔɪ/ as segments in the transcription of a phrase such as /ðəlʌkɪbɔɪz/.

We can take the same expression and describe it as a sequence of morphemes.

With these descriptions, we could characterize all the words and phrases of a language in terms of their phonology and morphology.
English Grammar

However, we have not accounted for the fact that the three words in this phrase can only be combined in a particular sequence. We recognize that the phrase *the lucky boys* is a well-formed phrase in contemporary English, but that the following two “phrases” are not at all well-formed.

(We use an asterisk * to indicate that a form is unacceptable or ungrammatical.)

From these examples, we can see that English has strict rules for combining words into phrases. The article (*the*) must go before the adjective (*lucky*), which must go before the noun (*boys*). So, in order to be grammatical, this type of phrase must have the sequence article + adjective + noun (and not *noun + article + adjective, for example).

The process of describing the structure of phrases and sentences in such a way that we account for all the grammatical sequences in a language and rule out all the ungrammatical sequences is one way of defining the grammar of a language. It is the kind of definition assumed when we talk about the grammar of English as opposed to the grammar of Swahili, Tagalog or Turkish. As illustrated in Chapter 6, each of these languages has different ways of forming grammatical phrases and sentences. Studying grammar in this way has a very long tradition.
Traditional Grammar

The terms “article,” “adjective” and “noun” that we use to label the grammatical categories of the words in the phrase the lucky boys come from traditional grammar, which has its origins in the description of languages such as Latin and Greek. Indeed, the expression “grammar school” was originally used exclusively for an institution where Latin was taught. Since there was a well-established grammatical description of Latin, based on earlier analyses of Greek, it seemed appropriate to adopt the existing categories from this description and apply them in the analysis of newer languages such as English. Because Latin and Greek were the languages of philosophy, religion and scholarship, the description of the grammatical components of these languages was taken to be the best model for other grammars. We have inherited a number of terms from the model that are used in describing those basic grammatical components, known as the “parts of speech,” and how they connect to each other in terms of “agreement.”
The Parts of Speech

Each part of speech, or word class, is illustrated in the following sentence and simple definitions of each technical term are listed below.

| The  | lucky boys found a backpack in |
|------|-------------------------|-----------------|-----------------|-----------------|-----------------|
| article | adjective | noun | verb | article | noun | preposition |

| the  | park and they opened it carefully |
|------|----------------|----------------|----------------|----------------|----------------|
| article | noun | conjunction | pronoun | verb | pronoun | adverb |

**Nouns**

are words used to refer to people (boy), objects (backpack), creatures (dog), places (school), qualities (roughness), phenomena (earthquake) and abstract ideas (love) as if they were all “things.” We begin proper nouns with a capital letter (Cathy, Latin, Rome).

**Articles**

are words (a, an, the) used with nouns to form noun phrases classifying those “things” (You can have a banana or an apple) or identifying them as already known (I’ll take the apple).

**Adjectives**

are words used, typically with nouns, to provide more information about the things referred to (large objects, a strange experience).

**Verbs**

are words used to refer to various kinds of actions (go, talk) and states (be, have) involving people and things in events (Jessica is ill and has a sore throat so she can’t talk or go anywhere).

**Adverbs**

are words used, typically with verbs, to provide more information about actions, states and events (slowly, yesterday). Some adverbs (really, very) are also used with adjectives to modify information about things (Really large objects move slowly. I had a very strange experience yesterday).

**Prepositions**

are words (at, in, on, near, with, without) used with nouns in phrases providing information about time (at five o’clock, in the morning), place (on the table, near the window) and other connections (with a knife, without a thought) involving actions and things.
**Pronouns** are words (*she, herself, they, it, you*) used in place of noun phrases, typically referring to people and things already known (*She talks to herself. They said it belonged to you.*).

**Conjunctions** are words (*and, but, because, when*) used to make connections and indicate relationships between events (*Chantel's husband was so sweet and he helped her a lot because she couldn’t do much when she was pregnant.*)
Agreement

In addition to the terms used for the parts of speech, traditional grammatical analysis has also given us a number of other categories, including “number,” “person,” “tense,” “voice” and “gender.” These categories can be discussed in isolation, but their role in describing language structure becomes clearer when we consider them in terms of agreement. For example, we say that the verb loves “agrees with” the noun Cathy in the sentence Cathy loves her dog.

This agreement is partially based on the category of number, that is, whether the noun is singular or plural. It is also based on the category of person, which covers the distinctions of first person (involving the speaker), second person (involving the hearer) and third person (involving any others). The different forms of English pronouns can be described in terms of person and number. We use I for first person singular, you for second person singular, and he, she, it (or Cathy) for third person singular. So, in the sentence Cathy loves her dog, we have a noun Cathy, which is third person singular, and we use the verb loves (not love) to “agree with” the noun.

In addition, the form of the verb must be described in terms of another category called tense. In this case, the verb loves is in the present tense, which is different from the past tense (loved). The sentence is also in the active voice, describing what Cathy does (i.e. she performs the action of the verb). An alternative would be the passive voice, which can be used to describe what happens to Cathy (i.e. she doesn’t perform the action), as in Cathy is loved by her dog or just Cathy is loved.

Our final category is gender, which helps us describe the agreement between Cathy and her in our example sentence. In English, we have to describe this relationship in terms of natural gender, mainly derived from a biological distinction between male and female. The agreement between Cathy and her is based on a distinction made in English between reference to female entities (she, her), male entities (he, his) and things or creatures, when the sex is unknown or irrelevant (it, its).

Figure 7.1 shows the basis of the agreement between Cathy and loves, and also between Cathy and her in the same sentence.

Figure 7.1
Grammatical Gender

The type of biological distinction based on “natural gender” in English is quite different from the more common distinction found in languages that use grammatical gender. Whereas natural gender is based on sex (male and female), grammatical gender is based on the type of noun (masculine and feminine) and is not tied to sex. In this system, nouns are classified according to their gender class and articles and adjectives have different forms to “agree with” the nouns’ gender.

Spanish, for example, has two grammatical genders, masculine and feminine, as in the expressions el sol (“the sun”) and la luna (“the moon”). German uses three genders, masculine der Mond (“the moon”), feminine die Sonne (“the sun”) and neuter das Feuer (“the fire”). The different forms of the articles in both the Spanish (el or la) and German (der, die or das) correspond to differences in gender class.

We should emphasize that this gender distinction is not based on a distinction in sex. A young girl is biologically female, but the German noun das Mädchen used to talk about her is grammatically neuter. The French noun in le livre (“the book”) is grammatically masculine, but neither we nor the French people consider a book to be biologically male. Grammatical gender is a very important category for the description of a number of languages. (For more on gender, see Chapter 20.)
The notion of appropriateness of analytic categories for a particular language has not always been a consideration. In traditional grammar books, tables such as the following were often presented for the analysis of English verbs, constructed by analogy with tables in Latin grammar, in this case for the verb *amare* (“to love”).

Each Latin verb form is different, based on the categories of person and number, yet the English verbs are (with one exception) mostly the same. Thus, in Latin, these descriptive categories characterize verb forms, but that is not the case in English. In English, the categories actually describe different forms of pronouns.
**The Prescriptive Approach**

It is one thing to adopt the grammatical labels (e.g. “noun,” “verb”) to categorize words in English sentences; it is quite another thing to go on to claim that the structure of English sentences should be like the structure of sentences in Latin. That was an approach taken in eighteenth-century England by grammarians who set out rules for the “proper” use of English. This view of grammar as a set of rules for the proper use of a language is still found today and is best characterized as the prescriptive approach. Some old-style prescriptive rules for English are:

*You must not split an infinitive*

*You must not end a sentence with a preposition*

Following these types of rules, traditional teachers would correct sentences like *Who did you go with?* to *With whom did you go?* (so that the preposition *with* was not at the end of the sentence). And *Mary runs faster than me* would be corrected to *Mary runs faster than I*. And one should never begin a sentence with *and*!

It may, in fact, be a valuable part of one’s education to be made aware of this “linguistic etiquette” for the use of language in certain contexts. Yet it is worth considering the origins of some of these rules and asking whether they have to be followed in English. Let’s look at one example: “You must not split an infinitive.”
Captain Kirk’s Infinitive

The infinitive in English has the form *to* + the base form of the verb, as in *to go*, and can be used with an adverb such as *boldly*. At the beginning of each of the older televised *Star Trek* episodes, one of the main characters, Captain Kirk, always used the expression *To boldly go* … This is an example of a split infinitive. Captain Kirk’s teacher might have expected him to say *To go boldly* or *Boldly to go*, so that the adverb didn’t split the infinitive. If Captain Kirk had been a Roman space traveler, speaking Latin, he would have used the expressions *ire* (“to go”) and *audacter* (“boldly”). Now, in saying *Ire audacter* … in Latin, Capitaneus Kirkus would not even have the opportunity to split his infinitive (*ire*), because Latin infinitives are single words and just do not split.

If it is a typical feature of the use of English that speakers and writers regularly produce forms such as *to boldly go*, *to solemnly swear* or *to never ever get back together*, then we may simply wish to note that there are structures in English that differ from those found in Latin, rather than think of the English forms as “bad” because they don’t follow a rule of Latin grammar.
The Descriptive Approach

It may be that using a well-established grammatical description of Latin is a useful guide for European languages (e.g. Spanish), is less useful for others (e.g. English), and may be absolutely misleading for non-European languages. This last point became clear to linguists trying to describe the structure of the native languages of North America toward the end of the nineteenth century. Because the categories of traditional grammar did not seem to fit these languages, a different method, called the descriptive approach, was adopted. Analysts collected samples of the language they were interested in and attempted to describe regular structures of that language as it was used, not according to some view of how it should be used.
Structural Analysis

One type of descriptive approach is called structural analysis and its main concern is to investigate the distribution of forms in a language. The method involves the use of “test-frames,” which can be sentences with empty slots in them.

The ______________ makes a lot of noise.

I heard a ______________ yesterday.

There are a lot of forms that can fit into these slots to produce good grammatical sentences of English (e.g. car, child, donkey, dog, radio). As a result, we can propose that, because all these forms fit in the same test-frame, they are likely to be examples of the same grammatical category, a “noun” (or N).

However, there are many forms that do not fit those test-frames. Examples would be Cathy, someone, the dog, a car and many others. (That is, we wouldn’t say *The Cathy or *The the dog.) For these forms, we require different test-frames:

______________ makes a lot of noise.

I heard ______________ yesterday.

Among other forms that comfortably fit these test-frames are it, the big dog, an old car, Ani Difranco, the professor with the Scottish accent and many other examples of the same grammatical category, a “noun phrase” (or NP).

Observing that it fits only in this second set of test-frames (*The it makes a lot of noise), allows us to improve on the Latin-influenced, analysis of pronouns in English. Pronouns were described as “words used in place of nouns.” We now see that it is better to say that pronouns are used in place of noun phrases (not just nouns).
Constituent Analysis

An approach with the same descriptive aims is called constituent analysis. The technique employed in this approach is designed to show how small constituents (or components) go together to form larger constituents. One basic step is determining how words go together to form phrases. In the following sentence, we can identify nine constituents at the word level: *The old woman brought a large snake from Brazil*. How do those nine constituents go together to form constituents at the phrase level? Does it seem appropriate to put the words together as follows?

| The old woman | brought | a large snake | from Brazil |

We don’t normally think of these combinations as phrases in English. We are more likely to say that the phrase-like constituents here are combinations of the following types: *The old woman, a large snake, Brazil* (noun phrases), *from Brazil* (a prepositional phrase) and *brought* (a verb).

This analysis of the constituent structure of the sentence can be represented in a diagram (Figure 7.2) showing the distribution of the constituents at different levels.

![Figure 7.2](image)

Using this kind of diagram we can determine the types of forms that can be substituted for each other at different levels of constituent structure. One advantage of this type of analysis is that it shows rather clearly that pronouns (*she, it*) and proper nouns or names (*Brazil*), though they are single words, can be used as noun phrases and fill the same constituent space as longer phrases (e.g. *the old woman* or *a large snake*). Figure 7.3 presents an analysis of the common constituent structure of many English sentences.

</tr>
</tbody>
</table>

Figure 7.3
Subjects and Objects

In Figure 7.3, we can see not only how small constituents combine to form larger constituents as phrases, we can also work out the different grammatical functions of those phrases. We use the term “noun phrase” when we describe the form of the expression (i.e. it has a noun or a pronoun in it). We use the terms “subject” and “object” to describe the different functions of noun phrases in a sentence. Since English uses position in the sentence to indicate grammatical function, we can normally identify the subject as the first noun phrase before the verb and the object as the noun phrase after the verb. The other phrase at the end of our example sentences is an adjunct, often a prepositional phrase, which typically provides additional information such as where, when or how the subject verb-ed the object. Figure 7.4 displays this analysis.

<table>

<tr>
<td>She kept it</td>

</tr>
</tbody>
</table>

There are a number of ways in which we can distinguish between noun phrases used as subjects versus objects. In addition to position differences, the subject is frequently the person or thing that the sentence is about and often the one that performs the action of the verb, whereas the object more typically represents the person or thing that undergoes the action. The subject noun phrase determines the form of the verb as singular or plural while the object noun phrase has no such effect. English also makes a clear distinction between pronouns used as subjects (I, he) and those used as objects (me, him). These differences between subjects and objects are summarized in Table 7.2. For more on objects, see Task F, page 102.

Word Order

The basic linear order of constituents in English is Noun Phrase–Verb–Noun Phrase (or NP V NP) and their typical grammatical functions are Subject–Verb–Object (or SVO), as shown in Table 7.3. Although we are actually talking about constituent order, this type of analysis is traditionally discussed in terms of word order. The English word order sequence is not the only possible, or even the most common word order among languages. The most common pattern is actually Subject–Object–Verb (SOV), as illustrated in the Japanese sentence in Table 7.3, with the verb at the end of the sentence. Japanese is a verb-final language.

In verb-initial languages, the sentence begins with the verb. As illustrated in Table 7.3, Scottish Gaelic has a Verb–Subject–Object (VSO) order and Malagasy (spoken in Madagascar) has a Verb–Object–Subject (VOS) order. Note that in Gaelic and Malagasy the adjective is placed after the noun (translated as “dog big”).
Language Typology

The use of word order patterns such as SVO or VOS to talk about different “types” of languages is part of a more general area of study known as language typology. This is the study of similarities in the grammatical structures of languages that allow them to be classified as members of the same type or group. The four main types are shown in Table 7.3. The other two possibilities, OSV and OVS, have been documented in a small number of languages in South America.
Why Study Grammar?

We began this chapter with the observation that in the grammar of English there are strict rules for combining words in a specific order to create phrases and sentences. In Table 7.3, we have expanded the analysis of those ordering rules to capture the different basic patterns that exist in most of the world’s languages. One advantage of having this information is that it may help explain some of the problems second language learners face when they try to acquire a language that simply does not have the same structural organization as their first language. If you are used to referring to the dog big or a bottle of wine red, you may unthinkingly employ those structures in a language that expects the big dog or a bottle of red wine. By helping students and teachers notice critical grammatical differences of this type between languages, we may be able to develop better awareness of what the learning task is and what might be beneficially included in language teaching materials.

Throughout this discussion we have focused on the linear order of constituents in grammatical structures. However, there is a lot of evidence to suggest that the linear order we observe is based on a set of underlying structures that are more abstract and organized in a more hierarchical way. We will explore the nature of this more abstract system in Chapter 8.
Study Questions

1 Identify all the parts of speech used in this sentence (e.g. \textit{woman} = noun): \textit{The woman kept a large snake in a cage, but it escaped recently.}

2 How many adverbs are there in the following sentence?

\textit{Really large objects move very slowly.}

3 What is the tense and voice of the verb in the following sentence?

\textit{My parents were married in Rome.}

4 What is the difference between grammatical gender and natural gender?

5 What prescriptive rules for the “proper” use of English are not obeyed in the following sentences and how would they be “corrected”?

(a) \textit{The old theory consistently failed to fully explain all the data.}
(b) \textit{I can’t remember the name of the person I gave the book to.}

6 How many noun phrases are there in the following sentence?

\textit{Robert brought a small puppy to the party and we all wanted to keep it.}

7 What was wrong with the older Latin-influenced definition of English pronouns?

8 What is the grammatical function of the proper noun in the following sentence?

\textit{The professor and her students visited Berlin during the summer.}

9 Is Malagasy a VSO language or something else?

10 Given these other Gaelic words, translate the following sentences into English:

\begin{center}
\begin{tabular}{lllll}
\textit{beag} (“small”) & \textit{bhual} (“hit”) & \textit{dubh} (“black”) & \textit{duine} (“man”) & \textit{gille} (“boy”) \\
\end{tabular}
\end{center}

(a) \textit{Bhual an gille beag an cu dubh}
(b) \textit{Chunnaic an cu an duine mor}
Tasks

A Another term used in the description of the parts of speech is “determiner.” What are determiners? How many examples were included in this chapter?

B In this chapter, we discussed “correction” in grammar. What is “hypercorrection”?

C All the underlined words in the following sentences are adverbs. On the basis of these sentences, can you formulate a simple rule of adverb position in English that would exclude the ungrammatical forms?

   (1) Do you usually wake up hungry?
   (2) Normally I don’t eat breakfast.
   (3) I’d rather sleep longer.
   (4) I always have a cup of green tea to start my day.
   (5) I’ll have some fruit juice occasionally.
   (6) Of course I’m often starving by lunchtime.
   (7) *I might have later a small snack or something.
   (8) *If I feel tired, I’ll drink sometimes coffee at work.

D What is aspect? How is it used to describe the underlined forms here?

   I hope no one calls while I’m eating lunch.
   She’s writing a story about her dog.
   I’ve eaten lunch already, thanks.
   She’s written a story about her cat and the cat next door.
   I was eating lunch, so I didn’t answer.
   She had written a story about her goldfish before that.
   As a child, she used to write stories about the insects in the garden.

E There are two constructions in English used to indicate possession, not only in the sense of “owning,” but more generally in the sense of “having.” They are the “s-genitive” (Bob’s book) and the “of-genitive” (the pages of the book).
(i) Look at the following set of examples and try to work out when each of the constructions is preferred.

(ii) In the s-genitive construction, to which constituent is the 's added (article, noun, noun phrase, verb or verb phrase)?

1. My friend’s father’s ex-wife came to the ceremony, which was a bit weird.
2. He emphasized the public’s need for safe transportation.
3. Do you watch CNN’s special reports?
4. Our house is much smaller than Henry’s.
5. She didn’t say anything at last week’s meeting.
6. They actually made it to the top of Mount Everest.
7. There’s an entrance at the side of the building.
8. I’ll love you till the end of time.
9. We didn’t recognize the size of the problem.
10. Do you remember the name of that actor who played President Lincoln in the film?

F What is the basis of the categorization of English verbs as transitive, intransitive or ditransitive? Can you use this categorization to explain why these sentences are ungrammatical?

1. *I thought I had lost my sunglasses, but Ali found in his car.
2. *Mark didn’t win, but he didn’t care that.
3. *They had a problem so we discussed.
4. *Suzy needed a jacket so I lent mine.
5. *We’re always waiting you because you’re late.
6. *I didn’t have a pen so Anne gave one.
7. *When it’s your birthday, people bring you.
8. *She smiled me yesterday when I saw her, so I think she really likes.
If people typically say *little plastic forks* (and not *plastic little forks*), there must be a preferred order of adjectives before nouns in the grammar of English. In this case, the adjective describing the size (*little*) goes before the adjective describing the material (*plastic*) of the noun (*forks*). How are other categories of adjectives ordered?

(i) Using the underlined examples in the following sentences, identify the other categories and complete the chart to capture the preferred order of descriptive adjectives in evidence here.

(ii) If we wanted to add those adjectives that express a subjective “opinion” to the chart (e.g. *beautiful, cute, horrible*), where would we put them relative to the other types?

1. *Japanese silk* scarves were very popular for many years.
2. *The plant has small round pink flowers.*
3. *The recent European results were not very encouraging.*
4. *They had uncovered some ancient square stones with carvings on them.*
5. *It looked like squiggly Arabic writing on the back of the card.*
6. *She was wearing a white cotton blouse with a short green skirt.*
7. *Her ring had an oval red ruby surrounded by tiny wedge-shaped diamonds.*
9. *The windows had dated Victorian-style lace curtains.*
10. *I was wearing my brand-new black leather shoes.*
11. *Yuri works downtown in one of those huge modern glass buildings.*
12. *The best bowls have circular blue Chinese designs in the middle.*
The sample sentences below are from (a) Latin and (b) Amuzgo, a language of Mexico (adapted from Merrifield et al., 2003)

(i) Using what you have learned about Latin, carefully translate this sentence: *The doves love the small girl.*

(ii) How would you write *A big woman is reading the red book* in Amuzgo?

(iii) In terms of basic word order, which of these languages is most similar to Amuzgo: English, Gaelic, Japanese, Latin or Malagasy?

J Malagasy is spoken in Madagascar, a large island off the coast of East Africa.
These examples from Malagasy are mostly based on Keenan and Ochs (1979). After analyzing the structures in (1)–(5) and (9)–(15), can you complete examples (6–8) and (16)–(18)?

(1) \textit{gaga aho} ("I’m surprised")
(2) \textit{noana izy} ("he’s hungry")

Discussion Topics/Projects

I In this chapter, we briefly mentioned the grammatical category of tense and illustrated the difference between past tense (loved) and present tense (loves). Using the examples below, and any others that you think are relevant, try to describe the “future tense” in English.

(1) *We may forgive, but we shall never forget.*
(2) *We’ll leave if you want.*
(3) *Jenny’s arriving at eight o’clock tonight.*
(4) *Your plane leaves at noon tomorrow.*
(5) *They were about to leave when I got there.*
(6) *We’re going to visit Paris next year.*
(7) *She said Jim was leaving next Wednesday.*
(8) *I wish I had a million dollars.*
(9) *The president is to visit Japan in May.*
(10) *Water will freeze at zero degrees centigrade.*

(For background reading, see the section on “Future” in Hurford, 1994.)

II In the descriptive approach, “ungrammatical” simply means “not well-formed” in purely structural terms. However, the word “ungrammatical” is also used with a more general meaning. Which of the following sentences should be considered “ungrammatical” in your opinion and why?

(1) *There’s hundreds of students waiting outside.*
(2) *Who’s there? It’s me and Lisa.*
(3) *Ain’t nobody gonna tell me what to do.*
(4) *You wasn’t here when he come looking for you.*
(5) *I hate lobsters anymore.*
(6) *Are y’all coming to see us soon?*
(7) *That chair’s broke, so you shouldn’t ought to sit on it.*
(8) *I can’t remember the name of the hotel that we stayed in it.*

(9) *I never seen anything.*

(10) *If you’d have come with, we’d have had more fun.*

In an early observation on the difficulties of getting computers to process natural language, Anthony Oettinger used the example above to illustrate how we tend to interpret sentences based on an expected structure and when we arrive at a problematic interpretation, we are able to go back and try to use a different structure. This process brings to light the importance of recognizing the underlying structure of sentences in order to make sense of them. If we keep thinking that the structure of the
second expression is the same as the first in the example, we will definitely miss something. (For a helpful analysis, see Figure 8.9, on page 122.)

In Chapter 7, we moved from the general categories of traditional grammar to more specific methods of describing the structure of phrases and sentences. When we concentrate on the structure and ordering of components within a sentence, we are studying the syntax of a language. The word “syntax” comes originally from Greek and literally means “a putting together” or “arrangement.” In earlier approaches, there was an attempt to produce an accurate description of the sequence or ordering “arrangement” of elements in the linear structure of the sentence. In more recent attempts to analyze structure, there has been a greater focus on the underlying rule system that we use to produce or “generate” sentences.
When we set out to provide an analysis of the syntax of a language, we try to adhere to the “all and only” criterion. This means that our analysis must account for all the grammatically correct phrases and sentences and only those grammatically correct phrases and sentences in whatever language we are analyzing. In other words, if we write rules for the creation of well-formed structures, we have to check that those rules, when applied logically, won’t also lead to ill-formed structures.

For example, we might say informally that, in English, we put a preposition (near) before a noun (London) to form a prepositional phrase (near London). This will describe a large number of phrases, but does it describe all (and only) the prepositional phrases in English? Note that, if we use this as a rule of the grammar to create structures involving a preposition and a noun, we will end up producing phrases like *near tree or *with dog. These don’t seem to be well-formed English structures, so we mark them with an asterisk *, indicating that they are ungrammatical.

We clearly need to be more careful in forming the rule that underlies the structure of prepositional phrases in English. We might have more success with a rule stating that we put a preposition before a noun phrase (not just a noun). In Chapter 7, we saw that a noun phrase can consist of a proper noun (London), a pronoun (me) or the combination of an article (a, the) with a noun (tree, dog), so that the revised rule can be used to produce these well-formed structures: near London, with me, near a tree, with the dog.
A Generative Grammar

When we have an effective rule such as “a prepositional phrase in English consists of a preposition followed by a noun phrase,” we can imagine an extremely large number of English phrases that could be produced using this rule. In fact, the potential number is unlimited. This reflects another goal of syntactic analysis, which is to have a small and finite (i.e. limited) set of rules that will be capable of producing a large and potentially infinite (i.e. unlimited) number of well-formed structures. This small and finite set of rules is sometimes described as a generative grammar because it can be used to “generate” or produce sentence structures and not just describe them.

This type of grammar should also be capable of revealing the basis of two other phenomena: first, how some superficially different phrases and sentences are closely related and, second, how some superficially similar phrases and sentences are in fact different.
Deep and Surface Structure

Our intuitions tell us that there must be some underlying similarity involving these two superficially different sentences: *Charlie broke the window* and *The window was broken by Charlie*. In traditional grammar, the first is called an active sentence, focusing on what *Charlie* did, and the second is a passive sentence, focusing on *The window* and what happened to it. The distinction between them is a difference in their surface structure, that is, the different syntactic forms they have as individual English sentences. However, this superficial difference in form disguises the fact that the two sentences are closely related, even identical, at a less superficial level.

This other “underlying” level, where the basic components (Noun Phrase + Verb + Noun Phrase) shared by the two sentences can be represented, is called their deep structure. The deep structure is an abstract level of structural organization in which all the elements determining structural interpretation are represented. That same deep structure can be the source of many other surface structures such as *It was Charlie who broke the window* and *Was the window broken by Charlie?*. In short, the grammar must be capable of showing how a single underlying abstract representation can become different surface structures.
Let’s say we have two distinct deep structures. One expresses the idea that “Annie had an umbrella and she bumped into a man with it.” The other expresses the idea that “Annie bumped into a man and the man happened to be carrying an umbrella.” Now, these two different versions of events can actually be expressed in the same surface structure form: Annie bumped into a man with an umbrella. This sentence provides an example of structural ambiguity. It has two distinct underlying interpretations that have to be represented differently in deep structure. Note that this is not the type of ambiguity that we experience in hearing Their child has grown another foot, which illustrates lexical ambiguity mainly because the word foot has more than one meaning. (See Task H, page 120, for further analysis.)

The comedian Groucho Marx knew how to have fun with structural ambiguity. In the film Animal Crackers, he first says I once shot an elephant in my pajamas, then follows it with How he got into my pajamas I’ll never know. In the non-funny interpretation, part of the underlying structure of the first sentence could be something like: “I shot an elephant (while I was) in my pajamas.” In the other (ho, ho) interpretation, part of the underlying structure would be something like: “I shot an elephant (which was) in my pajamas.” There are two different underlying structures with the same surface structure, revealed by syntactic analysis.

Structural Ambiguity
Syntactic Analysis

In syntactic analysis, we use some conventional abbreviations for the parts of speech identified in Chapter 7. Examples are N (= noun), Art (= article), Adj (= adjective) and V (= verb). We also use abbreviations for phrases, such as NP (= noun phrase) and VP (= verb phrase). In English, the verb phrase (VP) consists of the verb (V) plus the following noun phrase (NP). We can take the simple sentence from Table 7.3 (page 98) and label the constituents using these categories, as in Figure 8.1.

![Figure 8.1](image)

Figure 8.1 presents a static analysis of a single sentence. We would like to be able to represent the same syntactic information in a more dynamic format. One way of presenting the concept “consists of” is with an arrow (→), also interpreted as “rewrites as.” The following rule states that a noun phrase (NP) such as the dog consists of or rewrites as (→) an article (the) and a noun (dog). This simple formula is the underlying structure of millions of different English phrases.

\[
NP \rightarrow \text{Art } N
\]

However, it is not the only form a noun phrase can take. We want to be able to include another constituent (Adj) in the rule so that it is good for not only phrases like the dog, but also the big dog. This constituent is optional in a noun phrase, so we use round brackets to indicate that Adj is an optional constituent, as shown here:

\[
NP \rightarrow \text{Art (Adj) } N
\]
Another common symbol is in the form of curly brackets \( \{ \}. These indicate that only one of the elements enclosed within the curly brackets must be selected. We have already seen, in Figure 7.3, on page 96, that a noun phrase can also contain a pronoun (\textit{it}), or a proper noun (\textit{John}). Using the abbreviations “Pro” (for pronoun) and “PN” (for proper noun), we can write three separate rules, as shown on the left, but it is more succinct to write one rule, on the right, using curly brackets.

\[
\begin{align*}
\text{NP} & \rightarrow \text{Art (Adj) N} \\
\text{NP} & \rightarrow \text{Pro} \\
\text{NP} & \rightarrow \text{PN} \\
\text{NP} & \rightarrow \{\text{Art (Adj) N, Pro, PN}\}
\end{align*}
\]
Phrase Structure Rules

What we have started to create is a set of syntactic rules called phrase structure rules. As the name suggests, these rules state that the structure of a phrase of a specific type will consist of one or more constituents in a particular order.

The first rule in the following set of simple (and necessarily incomplete) phrase structure rules captures a very general rule of English sentence structure: “a sentence (S) rewrites as a noun phrase (NP) and a verb phrase (VP).” The second rule states that “a noun phrase rewrites as either an article plus an optional adjective plus a noun, or a pronoun, or a proper noun.” In the third rule, a verb phrase rewrites as a verb plus a noun phrase.

\[
S \rightarrow NP \ VP \\
NP \rightarrow \{Art \ (Adj) \ N, \ Pro, \ PN\} \\
VP \rightarrow V \ NP
\]
Lexical Rules

Phrase structure rules generate structures. In order to turn those structures into recognizable English, we also need lexical rules that specify which words can be used when we rewrite constituents such as PN. The first rule in the following set states that “a proper noun rewrites as John or Mary.” (It is a very small world.)

\[
\begin{align*}
\text{PN} & \rightarrow \{ \text{John, Mary} \} & \text{Art} & \rightarrow \{ a, \text{the} \} \\
\text{N} & \rightarrow \{ \text{girl, dog, boy} \} & \text{Adj} & \rightarrow \{ \text{big, small} \} \\
\text{V} & \rightarrow \{ \text{followed, helped, saw} \} & \text{Pro} & \rightarrow \{ \text{it, you} \}
\end{align*}
\]

We can rely on these rules to generate the grammatical sentences shown below in (1)–(6), but not the ungrammatical sentences shown in (7)–(12).

(1) *Dog followed boy.
(2) *You saw it.
(3) *John Mary small dog
(4) *Followed Mary the dog big.
(5) *The helped you boy
(6) *Mary John helped.
Tree Diagrams

One of the best ways to create a visual representation of underlying syntactic structure is through tree diagrams. We can use the symbols introduced earlier to label parts of the tree when we create a representation of how each part fits into the underlying structure of phrases. The information in a phrase structure rule, on the left, can be expressed in a tree diagram, on the right, as in Figure 8.2.

![Figure 8.2](image)

Although this kind of “tree,” with its “branches,” on the right, seems to grow down rather than up, it functions rather well as a diagram representing all the grammatical information found in the other analysis on the left. It also shows very explicitly that there are different levels in the analysis. That is, there is a level of analysis at which a constituent such as NP is represented and a different, lower, level at which a constituent such as N is represented.

We can use a similar tree diagram to represent the more complex structure of an English verb phrase (VP), as shown in Figure 8.3. Once again, this type of diagram provides a way of representing the hierarchical nature of underlying structure. In this
hierarchy, the verb phrase (VP) in higher than and contains the verb (V) and a noun phrase (NP). The noun phrase (NP) is higher than and contains the article (Art) and the noun (N).

Figure 8.3
We can now put together tree diagrams for whole sentences, hierarchically organized, as shown in Figure 8.4. Notice that essentially the same basic tree diagram structure is the foundation for all the different sentences (1)–(6), from page 112, with variable constituents included in each one.

Figure 8.4
Just Scratching the Surface

At the bottom of all the trees in Figure 8.4 are surface structure variations of a single underlying deep structure, revealing the generative power of the phrase structure rules involved. There are other phrase structure rules involved in the composition of more complex sentences. Some are presented in Task C on page 117 and Task I on page 120 for English, and Tasks E and F, on pages 118–119 for other languages. As we try to develop better ways of analyzing the syntactic structure of complex sentences, we inevitably need a larger analytic framework. (We have barely scratched the surface structures.) However, having explored some of the basic issues, terminology, representations and methods of syntactic analysis in order to talk about basic structures in the English language, we will now move on to consider how we might incorporate the analysis of meaning in the study of language.
Study Questions

1 What was the original literal meaning of *syntax* in Greek?

2 What is wrong with the following rule of English syntactic structure? “A prepositional phrase rewrites as a preposition followed by a noun.”

3 Which of the following expressions are structurally ambiguous and in what way?

   (a) *These are designed for small boys and girls.*
   (b) *The parents of the bride and groom were waiting outside.*
   (c) *How come a bed has four legs, but only one foot?*
   (d) *We met an English history teacher.*
   (e) *Flying planes can be dangerous.*
   (f) *The students complained to everyone that they couldn’t understand.*

4 What part of speech is *lovely* in the following sentence?

   *We saw a lovely rainbow yesterday.*

5 How many noun phrases are there in the following sentence?

   *George saw a small dog in the park near the fountain and it followed him when he left the park.*

6 Which part of the following sentence is the VP?

   *None of the people in the building supported the proposed rent increase.*

7 Which of the following expressions would be generated by this phrase structure rule: NP → {Art (Adj) N, Pro, PN}?

   (a) *a lady*  (c) *her*  (e) *the widow*
   (b) *the little girl*  (d) *Annie*  (f) *she’s an old woman*

8 What kind of generative rule is this: N → {girl, dog, boy}?
9 Do phrase structure rules represent deep structure or surface structure?

10 Complete the following tree diagrams.

(a) S

Tasks

A What is the distinction made between “competence” and “performance” in the study of syntax?

B What is meant by the expression “an embedded structure”? Were there any examples in this chapter?

C In some versions of syntactic analysis there are also “movement” rules that move parts of structures to different positions. For example, the statement You can see it becomes the question Can you see it? by moving one element (can) to the front. This element is an auxiliary (or “helping”) verb, as are could, should, will, would. They attach to verbs (follow, help, see) in the basic tree, as on the left in Figure 8.6, and are moved to the front to create a new tree, as on the right in Figure 8.6. In some descriptions, this change is called “inversion.”

Figure 8.6

A special arrow (⇒) is used to indicate that a constituent can be moved, as shown in this rule for Aux-movement: NP Aux VP ⇒ Aux NP VP.

Which of these structures would result from applying the Aux-movement rule?

(1) John will follow Mary.
(2) Can you see the dog?
(3) Could it follow you?
(4) The girl helped you.
(5) Could you help the dog?
(6) Mary should see it.
(7) Will the boy see you?
(8) Would John help the girl?
(9) It can see you.
(10) Can’t you follow it?

D In spoken English, the sequence want to is sometimes contracted to wanna, as in I don’t wanna go or What do you wanna do tonight?. However, as illustrated in the following set of sentences, there are some structures where want to cannot be contracted. English-speaking children know how to use wanna in the right places (and none of the wrong places) at a very early age. Can you work out what it is that they know about using wanna?

(1) Who do you want to or wanna visit?
(2) Who would you want to or wanna go out with?
(3) How many of your friends do you want to or wanna invite to the wedding?
(4) Who do you want to (*wanna) win the game?
(5) Who would you want to (*wanna) look after your pets?
(6) How many of your friends do you want to (*wanna) stay with us?

E The following simplified set of phrase structure rules describes part of the syntax of a language called Ewe, spoken in West Africa. Based on these rules, which of the following sentences (1)–(10) should have an asterisk * before them?

\[
\begin{align*}
S & \rightarrow \text{NP } \text{VP} \\
\text{NP} & \rightarrow \text{N (Art)} \\
\text{VP} & \rightarrow \text{V } \text{NP} \\
\text{N} & \rightarrow \{\text{oge, ika, amu}\} \\
\text{Art} & \rightarrow \text{ye} \\
\text{V} & \rightarrow \{\text{xu, vo}\}
\end{align*}
\]
F Using these simple phrase structure rules for Scottish Gaelic, identify (with *) the ungrammatical sentences and draw tree diagrams for the grammatical sentences.

NP → {Art N (Adj), PN}
Art → an
Adj → {ban, beag, mor}
N → cu, {duine, gille}
V → {bhuail, chunnaic, fhuair}
PN → {Calum, Mairi, Tearlach}

(1) Calum chunnaic an gille.
(2) Bhuail an beag cu Tearlach.
(3) Bhuail an gille mor an cu.
(4) Chunnaic Tearlach an gille.
(5) Ban an cu an duine beag.
(6) Fhuair Mairi an cu ban.

G The basic structure of a sentence in Tamasheq, spoken in north-west Africa, is illustrated as (1) in the sentences on page 120, but an emphasized element can be moved to front position, as shown in the other examples. All these examples are from Sudlow (2001: 47), with minor changes.

(i) After looking at the syntactic structure of each Tamasheq sentence, can you add these English translations to appropriate places in the chart?

“Isn’t men who cook porridge.”
“Porridge, men aren’t the ones who cook it.”
“Men don’t cook porridge?”
“Men aren’t the ones who cook porridge.”

(ii) Using information from Chapters 7 and 8, can you decide which of these languages has the same basic sentence structure as Tamasheq, as shown in example (1): English, Ewe, Gaelic, Japanese, Latin?

H Which of the following two tree diagrams could be used to represent the underlying structure of the sentence: George saw the boy with a telescope?
The concept of recursion is used in syntax to describe the repeated application of a rule to the output of an earlier application of the rule. For example, we can use the terms “complementizer” (C) for the English word *that*, and “complement phrase” (CP) for *that Mary helped you* as part of the sentence *Cathy knew that Mary helped you*. In the complement phrase, the part *Mary helped you* represents a sentence (S), so there must be a rule: CP → C S, or “a complement phrase rewrites as a complement and a sentence.”

This provides us with a small set of rules incorporating recursion. (Note that when you reach the end of this set of rules, you can keep going back to the beginning and repeating the sequence. That is the essence of recursion.)

<table>
<thead>
<tr>

Using these rules, fill in the missing elements in the tree diagram in Figure 8.8.
John believed that Cathy knew that Mary helped you

Figure 8.8
Discussion Topics/Projects

I There is a principle of syntax called “structure dependency” that is often used to show that the rules of language structure depend on hierarchical organization and not on linear position. For example, someone trying to learn English might be tempted to think that questions of the type in (2) are formed simply by moving the second word in a statement (1) to become the first word of a question (2).

(1) Shaggy is tired.
(2) Is Shaggy tired?

You will help him.
Will you help him?

Using the sentences in (2)–(6), try to decide if this is the best way to describe how all of these English questions are formed and, if it is not, try to formulate a better rule.

(3) Are the exercises in this book too easy?
(4) Is the cat that is missing called Blackie?
(5) Will the price of the new book you’ve ordered be really expensive?
(6) Was the guy who scored the winning goal in the final playing for love or money?

(For background reading, see chapter 3 of Fromkin, Rodman and Hyams, 2014.)

II We could propose that passive sentences (George was helped by Mary) are derived from active structures (Mary helped George) via a rule such as the following:

(active) NP₁ V NP₂ => NP₂ be V-ed by NP₁ (passive)

Note that the tense, past or present, of the V (e.g. helped) in the active structure determines the tense of be in the passive structure (e.g. was helped). Which of the following active sentences can be restructured into passive sentences using this rule? What prevents the rule from working in the other cases?

(1) The dog chased the cat.
(2) Snow White kissed Grumpy.
(3) He loves them.
(4) Betsy borrowed some money from Christopher.

(5) The team played badly.

(6) The bank manager laughed.

(7) They have two children.

(8) The duckling became a swan.

(9) Someone mentioned that you played basketball.

(10) The police will arrest violent demonstrators.

(For background reading, see Morenberg, 2013.)

Note: The different underlying structures in Oettinger’s (1966: 168) example, *Time flies like an arrow; fruit flies like a banana*, cited at the beginning of this chapter, can be represented in the following tree diagrams. The different structures depend on some lexical ambiguity since *flies* is a verb in the first part and a noun in the second part. Also *like* is a preposition in the first part and a verb in the second part.

This one time I was flying out of SFO (San Francisco) and I happened to have a jar of home-made quince preserves in my carry-on. A TSA (Transportation Security Administration) agent stopped me, saying that the quince preserves couldn’t come aboard because no gels, liquids, or aerosols were allowed past the checkpoint. I asked him politely which of those quince preserves were: gel, liquid, or aerosol, because they seemed a lot like fruit. His response, and I kid you not, was “Sir, I’m not going to argue semantics with you.”

Bergen (2012)
Semantics is the study of the meaning of words, phrases and sentences. In semantic analysis, there is always an attempt to focus on what the words conventionally mean, rather than on what an individual speaker might think they mean, or want them to mean, on a particular occasion. This approach is concerned with linguistic meaning that is shared by all competent users of the language. Doing semantics is attempting to spell out what it is we all know when we behave as if we share knowledge of the meaning of a word, a phrase, or a sentence in a language.
Meaning

While semantics is the study of meaning in language, there is more interest in certain aspects of meaning than in others. We have already ruled out special meanings that one individual might attach to words or what TSA agents believe words mean, as in Ben Bergen’s story quoted earlier. That is, our main interest is in what we might describe as the widely accepted objective or factual meaning of words and not their subjective or personal meaning. This distinction is generally presented in terms of referential meaning as opposed to associative or emotive meaning, such as feelings or reactions to words that may be found among some individuals or groups but not others.

Referential meaning covers those basic, essential components of meaning that are conveyed by the literal use of a word. It is the type of meaning that dictionaries are designed to describe. Some of the basic components of a word like needle in English might include “thin, sharp, steel instrument.” These components would be part of the referential meaning of needle. However, different people might have different associations or connotations attached to a word like needle. They might associate it with “pain,” or “illness,” or “blood,” or “drugs,” or “thread,” or “knitting,” or “hard to find” (especially in a haystack), and these associations may differ from one person to the next. These associations can’t be part of the word’s referential meaning.

One way in which the study of basic referential meaning might be helpful would be as a means of accounting for the “oddness” we experience when we read sentences such as the following:

*The hamburger ate the boy.*
*The table listens to the radio.*
*The horse is reading the newspaper.*

We should first note that the oddness of these sentences does not derive from their syntactic structure. According to the basic syntactic rules for forming English sentences (presented in Chapter 8), we have well-formed structures.

<table>
<thead>
<tr>
<th>NP</th>
<th>V</th>
<th>NP</th>
</tr>
</thead>
<tbody>
<tr>
<td>The hamburger</td>
<td>ate</td>
<td>the boy</td>
</tr>
</tbody>
</table>
This sentence is syntactically good, but semantically odd. Since the sentence *The boy ate the hamburger* is perfectly acceptable, we may be able to identify the source of the problem. The components of the referential meaning of the noun *hamburger* must be significantly different from those of the noun *boy*, allowing one, not the other, to “make sense” with the verb *ate*. Quite simply, the kind of noun used with *ate* must denote an entity that is capable of “eating.” The noun *hamburger* doesn’t have this property and the noun *boy* does.
Semantic Features

We can make this observation more generally applicable by trying to determine the crucial element or feature of meaning that any noun must have in order to be used as the subject of the verb *ate*. Such an element may be as general as “animate being.” We can then use this idea to describe part of the meaning of words as having either plus (+) or minus (–) that particular feature. So, the feature that the noun *boy* has is “+animate” (= denotes an animate being) and the feature that the noun *hamburger* has is “–animate” (= does not denote an animate being).

This simple example is an illustration of a procedure for analyzing meaning in terms of semantic features. Features such as “+animate / –animate,” “+human / –human,” “+female / –female,” for example, can be treated as the basic elements involved in differentiating the meaning of each word in a language from every other word. If we had to provide the crucial distinguishing features of the meanings of a set of English words such as *table, horse, boy, man, girl, woman*, we could begin with the chart in Table 9.1.

<table>
<thead>
<tr>
<th></th>
<th>table</th>
<th>horse</th>
<th>boy</th>
<th>man</th>
<th>girl</th>
<th>woman</th>
</tr>
</thead>
<tbody>
<tr>
<td>animate</td>
<td>–</td>

<td>–</td>
<td>+</td>
<td>+</td>
</tr>
<tr>
<td>adult</td>
<td>–</td>
<td>+</td>
<td>–</td>
<td>+</td>
<td>–</td>
<td>+</td>
</tr>
</tbody>
</table>

From a feature analysis like this, we can say that at least part of the meaning of the word *girl* in English involves the elements [+human, +female, –adult]. We can also characterize the feature that is crucially required in a noun in order for it to appear as the subject of a particular verb, supplementing the syntactic analysis with semantic features. We can then predict which nouns (e.g. *hamburger, horse, table*) would make the sentence semantically odd. Some verbs may simply require subjects that have the feature [+animate], while others will be more specific and need [+human], as in these two examples.

\[ N \quad [+animate] \]

The ___________________________ are all the food.
The _____________ ate all the food.

N [+animate]

N [+human]

The _____________ is reading the newspaper.

The _____________ is reading the newspaper.

N [+human]
Words as Containers of Meaning

The approach just outlined is a start on analyzing the basic components of word meaning, but it is not without problems. For many words in a language it may not be as easy to come up with neat components of meaning. If we try to think of the components or features we would use to differentiate the nouns advice, threat and warning, for example, we may not be very successful. Part of the problem seems to be that the approach involves a view of words in a language as some sort of “containers” that carry meaning components. This approach seems to be too restrictive and very limited in terms of practical use. There is more to the meaning of words than these basic types of features.
Semantic Roles

Instead of thinking of words as containers of meaning, we can look at the “roles” they fulfill within the situation described by a sentence. If the situation is a simple event, as in *The boy kicked the ball*, then the verb describes an action (*kick*). The noun phrases in the sentence describe the roles of entities, such as people and things, involved in the action. We can identify a small number of semantic roles (also called “thematic roles” or “case roles”) for these noun phrases.
Agent and Theme

In our example sentence, one role is taken by the noun phrase *The boy* as “the entity that performs the action,” technically known as the **agent**. Another role is taken by *the ball* as “the entity that is involved in or affected by the action,” which is called the **theme** (or sometimes the “patient”). The theme can also be an entity (*The ball*) that is simply being described (i.e. not performing an action), as in *The ball was red*.

Agents and themes are the most common semantic roles. Although agents are typically human (*The boy*), as in (1) below, they can also be non-human entities that cause actions, as in noun phrases denoting a natural force (*The wind*), a machine (*A car*), or a creature (*The dog*), all of which affect *the ball* as theme in examples (2)–(4). The theme is typically non-human, but can be human (*the boy*), as in the last sentence (5).

(1) *The boy kicked the ball.*
(2) *The wind blew the ball away.*
(3) *A car ran over the ball.*
(4) *The dog caught the ball.*
(5) *The dog chased the boy.*
Instrument and Experiencer

If an agent uses another entity in order to perform an action, that other entity fills the role of instrument. In the sentences *The boy cut the rope with an old razor* and *He drew the picture with a crayon*, the noun phrases *an old razor* and *a crayon* are being used in the semantic role of instrument. Note that the preposition *with* is often a clue that the following noun phrase has the role of instrument in English. A related use of *with* is explored in Task G, and noun phrases marked as instruments in another language (Lakhota) can be found in Task H, both on page 137.

When a noun phrase is used to designate an entity as the person who has a feeling, perception or state, it fills the semantic role of experiencer. If we *feel, know, hear* or *enjoy* something, we are not really performing an action (hence we are not agents). We are in the role of experiencer. In the first sentence below, the experiencer (*The woman*) is the only semantic role. In the second example, the question is asking if (*you*) had the experience of hearing the theme (*that noise*).

*The woman feels sad.*

*Did you hear that noise?*
Location, Source and Goal

A number of other semantic roles designate where an entity is in the description of an event. Where an entity is (on the table, in the room) fills the role of location. Where the entity moves from is the source (from Chicago) and where it moves to is the goal (to New Orleans), as in We drove from Chicago to New Orleans. When we talk about transferring money from savings to checking, the source is savings and the goal is checking. (Other examples are presented in Task I, page 138.)

All these semantic roles are illustrated in the following scenario. Note that a single entity (e.g. George) can appear in several different semantic roles.

Lexical Relations

Not only can words be treated as containers of meaning, or as fulfilling roles in events, they can also have “relationships” with each other. In everyday talk, we often explain the meanings of words in terms of their relationships. If we are asked the meaning of the word conceal, for example, we might simply say, “It’s the same as hide,” or give the meaning of shallow as “the opposite of deep,” or the meaning of pine as “a kind of tree.” In doing so, we are characterizing the meaning of each word, not in terms of its component features, but in terms of its relationship to other words. This approach is used in the semantic description of language and treated as the analysis of lexical relations. The lexical relations we have just exemplified are synonymy (conceal/hide), antonymy (shallow/deep) and hyponymy (pine/tree).
Synonymy

Two or more words with very closely related meanings are called synonyms. They can often, though not always, be substituted for each other in sentences. In the appropriate circumstances, we can say, *What was his answer?* or *What was his reply?* with much the same meaning. Other common examples of synonyms are the following pairs:

<table>
<thead>
<tr>
<th>almost/nearly</th>
<th>big/large</th>
<th>broad/wide</th>
<th>buy/purchase</th>
</tr>
</thead>
<tbody>
<tr>
<td>cab/taxi</td>
<td>car/automobile</td>
<td>couch/sofa</td>
<td>doctor/physician</td>
</tr>
<tr>
<td>freedom/liberty</td>
<td>handbag/purse</td>
<td>hard/difficult</td>
<td>sweat/perspire</td>
</tr>
</tbody>
</table>

We should keep in mind that the idea of “sameness” of meaning used in discussing synonymy is not necessarily “total sameness,” and it is best to think of these pairs as “close synonyms.” There are many occasions when one word is appropriate in a sentence, but its synonym would be odd. For example, whereas the word *answer* fits in the sentence *Sandy had only one answer correct on the test*, the word *reply* would sound odd. Although *broad* and *wide* can both be used to describe a street in a similar way, we only talk about being *in broad agreement* (not *wide*) and *in the whole wide world* (not *broad*). There are also regional differences in the use of synonymous pairs, with *candy, chips, diaper* and *gasoline* in American English being equivalents of *sweets, crisps, nappy* and *petrol* in British English.

Synonymous forms may also differ in terms of formal versus informal uses. The sentence *My father purchased a large automobile* has virtually the same meaning as *My dad bought a big car*, with four synonymous replacements, but the second version sounds much more casual or informal than the first.
Antonymy

Two forms with opposite meanings are called antonyms. Some common examples are the pairs:

<table>
<thead>
<tr>
<th>alive/dead</th>
<th>big/small</th>
<th>buy/sell</th>
<th>enter/exit</th>
<th>fast/slow</th>
</tr>
</thead>
<tbody>
<tr>
<td>happy/sad</td>
<td>hot/cold</td>
<td>long/short</td>
<td>male/female</td>
<td>married/single</td>
</tr>
<tr>
<td>old/new</td>
<td>raise/lower</td>
<td>rich/poor</td>
<td>smart/stupid</td>
<td>true/false</td>
</tr>
</tbody>
</table>

Antonyms are usually divided into three main types, “gradable” (opposites along a scale), “non-gradable” (direct opposites) and “reversives” (one is the reverse action of the other). We can use gradable antonyms in comparative constructions involving adjectives, as in these underlined examples: I’m smaller than you and slower, sadder, colder, shorter and older, but luckily quite a bit richer. Also, the negative of one member of a gradable pair does not necessarily imply the other. For example, the sentence My car isn’t old doesn’t have to mean My car is new.

With non-gradable antonyms (also called “complementary pairs”), comparative constructions are not normally used. We don’t typically describe someone as deader or more dead than another. Also, using the “negative test,” we can see that the negative of one member of a non-gradable pair does imply the other member. That is, My grandparents aren’t alive does indeed mean My grandparents are dead. Other non-gradable antonyms are the pairs: male/female, married/single and true/false.

Although we can use the “negative test” to identify non-gradable antonyms in a language, we usually avoid describing one member of an antonymous pair as the negative of the other. For example, while undress can be treated as the opposite of dress, it does not mean “not dress.” It actually means “do the reverse of dress.” Antonyms of this type are called reversives. Other examples are enter/exit, pack/unpack, lengthen/shorten, raise/lower, tie/untie. (See Tasks C and D, page 136.)
Hyponymy

When the meaning of one form is included in the meaning of another, the relationship is described as hyponymy. Examples are the pairs: animal/horse, insect/ant, flower/rose. The concept of “inclusion” involved in this relationship is the idea that if an object is a rose, then it is necessarily a flower, so the meaning of flower is included in the meaning of rose. Or, rose is a hyponym of flower.

When we investigate connections based on hyponymy, we are essentially looking at the meaning of words in some type of hierarchical relationship. Try to think quickly of a basic meaning for each of these words: banyan, parakeet, terrier, turnip. You can check Figure 9.1 to see if your meaning included hyponymy.

Looking at the examples in Figure 9.1, we can say that “horse is a hyponym of animal,” “ant is a hyponym of insect” and “turnip is a hyponym of vegetable.” In these three examples, animal, insect and vegetable are called the superordinate (= higher level) terms. We can also say that two or more words that share the same superordinate term are co-hyponyms. So, dog and horse are co-hyponyms and the superordinate term is animal, while ant and cockroach are co-hyponyms with insect as the superordinate. Or schnauzer and yorkie are co-hyponyms, with terrier as one superordinate and dog as another at a more general level.
The relation of hyponymy captures the concept of “is a kind of,” as when we give the meaning of a word by saying, “a schnauzer is a kind of dog.” Sometimes the only thing we know about the meaning of a word is that it is a hyponym of another term. That is, we may know nothing more about the meaning of the word yorkie other than that it is a kind of dog (also known as a Yorkshire terrier) or that banyan is a kind of tree.

Of course, it is not only words for “things” that are hyponyms. Words such as punch, shoot and stab, as verbs describing “actions,” can all be treated as co-hyponyms of the superordinate term injure and the verbs bake, boil, fry and grill as co-hyponyms of the superordinate cook. For a lot of people, microwave has become another one.
Prototypes

While the words canary, cormorant, dove, duck, flamingo, parrot, pelican and robin are all equally co-hyponyms of the superordinate bird, they are not all considered to be equally good examples of the category “bird.” According to some researchers, the most characteristic instance of the category “bird” is robin. The idea of “the characteristic instance” of a category is known as the prototype. The concept of a prototype helps explain the meaning of certain words, like bird, not in terms of component features (e.g. “has feathers,” “has wings”), but in terms of resemblance to the clearest example. Thus, we might wonder if ostrich or penguin should be hyponyms of bird (technically they are), but we have no trouble deciding about sparrow or pigeon. These last two are much closer to the prototype.

Given the category label furniture, we are quick to recognize chair as a better example than bench or stool. Given clothing, people recognize shirts quicker than shoes, and given vegetable, they accept carrot before potato or turnip. It is clear that there is some general pattern to the categorization process involved in prototypes and that it determines our interpretation of word meaning. However, this is one area where individual experience can lead to substantial variation in interpretation. People may disagree over the categorization of words like avocado or tomato and treat them as co-hyponyms of both fruit and vegetable in different contexts.
Homophones and homonyms

When two or more different (written) forms have the same pronunciation, they are described as homophones. Common English examples are:

<table>
<thead>
<tr>
<th>bare/bear</th>
<th>flour/flower</th>
<th>meat/meet</th>
<th>pail/pale</th>
</tr>
</thead>
<tbody>
<tr>
<td>pair/pear</td>
<td>right/write</td>
<td>sew/so</td>
<td>to/too/two</td>
</tr>
</tbody>
</table>

We use the term homonyms when one form (written or spoken) has two or more unrelated meanings, as in these examples:

- bat (flying creature) – bat (used in sports)
- mole (on skin) – mole (small animal)
- pen (writing instrument) – pen (enclosed space)
- race (contest of speed) – race (ethnic group)
- sole (single) – sole (part of foot or shoe)

The temptation is to think that the two types of bat must be related in meaning. They are not. Homonyms are words that have separate histories and meanings, but have accidentally come to have exactly the same form.
Polysemy

When we encounter two or more words with the same form and related meanings, we have what is technically known as polysemy. Polysemy (from Greek *poly* “many” and *semy* “meanings”) can be defined as one form (written or spoken) having multiple meanings that are all related by extension. Examples are the word *head*, used to refer to the object on top of your body, froth on top of a glass of beer, person at the top of a company or department or school and many other things. Other examples of polysemy are *foot* (of a person, of a bed, of a mountain), *mouth* (part of a face, a cave, a river) or *run* (person does, water does, colors do).

If we are not sure whether different uses of a single word are examples of homonymy or polysemy, we can check in a dictionary. If the word has multiple meanings (i.e. it is polysemous), there will be a single entry, with a numbered list of the different meanings. If two words are homonyms, they will have two separate entries. In most dictionaries, *bat*, *mail*, *mole*, and *sole* are treated as homonyms whereas *face*, *foot*, *get*, *head* and *run* are treated as examples of polysemy.

Of course, it is possible for two forms to be distinguished via homonymy and for one of the forms also to have various uses via polysemy. The words *date* (= a thing we can eat) and *date* (= a point in time) are homonyms. However, the “point in time” kind of *date* is polysemous in terms of a particular day and month (= on a letter), an arranged meeting time (= an appointment), a social meeting (= with someone we like) and even a person (= that person we like). So the question *How was your date?* could have a number of different interpretations.
These last three lexical relations are the basis of a lot of word play, usually for humorous effect. In the nursery rhyme *Mary had a little lamb*, we think of a small animal, but in the comic version *Mary had a little lamb, some rice and vegetables*, we think of a small amount of meat. The polysemy of *lamb* allows the two interpretations. It is recognizing the polysemy of *leg* and *foot* in the riddle *What has four legs, but only one foot?* that leads to a solution (*a bed*).

We can make sense of another riddle *Why are trees often mistaken for dogs?* by recognizing the homonymy in the answer: *Because of their bark*. Shakespeare used homophones (*sun/son*) for word play in the first lines of the play *Richard III*:

```
Now is the winter of our discontent
Made glorious summer by this sun of York.
```

And if you are asked the following question: *Why is 6 afraid of 7?*, you can understand why the answer is funny (*Because 789*) by identifying the homophones.
Metonymy

The relatedness of meaning found in polysemy is essentially based on similarity. The head of a company is similar to the head of a person on top of and controlling the body. There is another type of relationship between words, based simply on a close connection in everyday experience. That close connection can be based on a container–contents relation (bottle/water, can/juice), a whole–part relation (car/wheels, house/roof) or a representative–symbol relationship (king/crown, the President/the White House). Using one of these words to refer to the other is an example of metonymy.

It is our familiarity with metonymy that makes it possible for us to understand He drank the whole bottle, although it sounds absurd literally (i.e. he drank the liquid, not the glass object). We also accept The White House has announced … or Downing Street protested … without being puzzled that buildings appear to be talking. We use metonymy when we talk about filling up the car, answering the door, boiling a kettle, giving someone a hand, or needing some wheels. (See Task F, page 136, for more.)
Collocation

One final aspect of our knowledge of words, and how they are used, has nothing to do with any of the factors considered so far. As mature speakers of a language, we all know which words tend to occur with other words. If you ask a thousand people what they think of when you say hammer, more than half will say nail. If you say table, they’ll mostly say chair, and butter elicits bread, needle elicits thread and salt elicits pepper. One way we seem to organize our knowledge of words is simply on the basis of collocation, or frequently occurring together.

In recent years, the study of which words occur together, and their frequency of co-occurrence, has received a lot more attention in corpus linguistics. A corpus is a large collection of texts, spoken or written, typically stored as a database in a computer. Those doing corpus linguistics can then use the database to find out how often specific words or phrases occur and what types of collocations are most common. Some of the most common collocations are actually everyday phrases which may consist of several words used together, as in I don’t know what to do (six words), you know what I mean (five words) or they don’t want to (four words). See Task F, page 246, for more examples.

Research of this type provides more evidence that our understanding of what words and phrases mean is tied to the contexts in which they are typically used. We will look at other aspects of the role of context in the interpretation of meaning in Chapter 10.
Study Questions

1. What semantic feature must a noun have in order to be used in this sentence? *The ___________ were discussing what to do.*

2. Using semantic features, how would you explain the oddness of these sentences?
   (a) *The television drank my water.*
   (b) *His dog writes poetry.*

3. What phrase is used more often instead of “thematic roles” and what other term is used instead of “theme” in the semantic analysis of noun phrases?

4. What kind of opposites can be identified via the “negative test”?

5. How is the term “prototype” used in semantics?

6. Identify the roles of the seven noun phrases in this sentence:
   *With her new golf club, Anne Marshall whacked the ball from the woods to the grassy area near the hole and she suddenly felt invincible.*

7. Which of the following words are co-hyponyms?
   *ant, cabbage, insect, plant, turnip, vegetable*

8. What is the basic lexical relation between each pair of words listed here?

10. Are the underlined words in these sentences best described as examples of polysemy or metonymy?
(a) The pen is mightier than the sword.

(b) I had to park on the shoulder of the road.

(c) Yes, I love those. I ate a whole box on Sunday!

(d) The bookstore has some new titles in linguistics.

(e) Computer chips created an important new technology

(f) I’m going to sue your ass!

(g) I think that kind of music was called new wave.

E Another less common relation between word meanings is known as transferred epithet or hypallage. Why do we need to talk about this special type of meaning relation in the analysis of the meaning of the phrases listed here? Can you think of any other similar examples?

| a quiet cup of coffee | a nude photo        | a sleepless night   | one of my clever days |

F Metonymy and synecdoche (/sɪŋɛkˈdəki/) are two ways of using words with non-literal meanings. Can you identify the clear uses of synecdoche in these examples?

(1) I read in a magazine that you shouldn’t wear pink if you’re a redhead.
Some people expect the government to look after them from the cradle to the grave.

There has been a significant increase in reports of white-collar crime.

I was surprised when five new faces turned up in my first class.

If I don’t want to spend too much, I take a small amount of cash in my pocket and leave the plastic at home.

The Pentagon has announced plans to upgrade their cybersecurity.

They have something on the menu called “Surf and Turf,” which consists of both fish and steak on the same plate.

We’ll never have progress as long as the greybeards remain in control.

G There is often a connection between English prepositions and semantic roles.

(i) Can you use an analysis based on semantic roles to explain the use of the prepositions by and with in the following examples?

(ii) Why are examples (5)–(8) treated as ungrammatical?

(1) The walls of her room were decorated with large posters.

(2) One of the roads was blocked by a fallen tree.

(3) The store was robbed by a masked man with a gun.

(4) A small band of rebels was defeated by a larger force with superior weapons.

(5) * I was surprised with the sudden bang outside my window.

(6) * Most of his sketches were drawn by charcoal.

(7) * Some people are embarrassed with photos from their teenage years.

(8) * The Christmas tree was covered by ornaments and lights.

H In English, the semantic role of instrument is often expressed in a prepositional phrase (She opened the can with a knife; He stopped the ball with his hand). In other languages the instrument may be expressed via an affix, as in the following examples from Lakhota, a Native American language spoken in North and South Dakota.

<table>

Discussion Topics/Projects

I One way to analyze the semantic structure of sentences is to start with the verb as the central element and define the semantic roles required by that verb. (This is sometimes called “theta assignment.”) For example, a verb like *kill* requires an agent and a theme, as in *The cat [agent] killed the mouse [theme]*. A verb like *give* requires an agent, a theme and a goal, as in *The girl [agent] gave the flowers [theme] to her mother [goal]*. We can present these observations in this way:

- *kill* [Agent __________ Theme]
- *give* [Agent __________ Theme, Goal]

How would you define the set of semantic roles for the following verbs, using the format illustrated? Are there required roles and optional roles?

II The words in the following list are all related in terms of the superordinate form *tableware*. How would you go about determining what the prototype item of “tableware” must be? Is a hierarchical diagram illustrating hyponymous relations useful? Would it be helpful to list some (or all) of the words beside a scale from 5 (= “excellent example of tableware”) to 1 (= “not really an example of tableware”) and ask people to indicate their choices on the scale? Do you think that the word with the highest score would indicate the prototype?

In the late 1960s, two elderly American tourists who had been touring Scotland reported that, in their travels, they had come to a Scottish town in which there was a great ruined cathedral. As they stood in the ruins, they saw a small boy and they asked him when the cathedral had been so badly damaged. He replied in the war. Their immediate interpretation, in the 1960s, was that he must be referring to the Second World War which had ended only twenty years earlier. But then they thought that the ruins looked as if they had been in their dilapidated state for much longer than that, so they asked the boy which war he meant. He replied the war with the English, which, they eventually discovered, had formally ended in 1745.

Brown (1998)
In Chapter 9, we focused on referential meaning and the relationships between words. There are other aspects of meaning that depend more on context and the communicative intentions of speakers. In Gill Brown’s story, the American tourists and the Scottish boy seem to be using the word *war* with essentially the same basic meaning. However, the boy was using the word to refer to something the tourists didn’t expect, hence the initial misunderstanding. Communication clearly depends on not only recognizing the meaning of words in an utterance, but also recognizing what speakers mean by their utterances in a particular context. The study of what speakers mean, or “speaker meaning,” is called *pragmatics*.
Invisible Meaning

In many ways, pragmatics is the study of “invisible” meaning, or how we recognize what is meant even when it is not actually said or written. In order for that to happen, speakers (or writers) must be able to depend on a lot of shared assumptions and expectations when they try to communicate. The investigation of those assumptions and expectations provides us with some insights into how we understand more than just the linguistic content of utterances. From the perspective of pragmatics, more is always being communicated than is said.

There are lots of illustrations of this pragmatic principle. Driving by a parking garage, you may see a large sign like the one in the picture (Figure 10.1). You read the sign, knowing what each of the words means and what the sign as a whole means. However, you don’t normally think that the sign is advertising a place where you can park your “heated attendant.” (You take an attendant, you heat him/her up, and this is where you can park him/her.) Alternatively, the sign may indicate a place where parking will be carried out by attendants who have been heated. (Maybe they will be more cheerful.) The words in the sign may allow these interpretations, but we would normally understand that we can park a car in this place, that it is a heated area, and that there will be an attendant to look after the car. So, how do we decide that the sign means this when the sign doesn’t even have the word car on it?
Context

It must be the case that we use the meanings of the words, the context in which they occur, and some pre-existing knowledge of what would be a likely message as we work toward a reasonable interpretation of what the producer of the sign intended it to convey. Our interpretation of the “meaning” of the sign is not based solely on the words, but on what we think the writer intended to communicate.

We can illustrate a similar process with our second example (Figure 10.2), taken from a newspaper advertisement. If we only think about the meaning of the phrase as a combination of the meanings of the words, using *Furniture Sale* as an analogy, we might arrive at an interpretation in which someone is announcing the sale of some very young children. Of course, we resist this possible interpretation and recognize instead that it is advertising a sale of clothes for those young children. The word *clothes* is nowhere in the message, but we bring that idea to our interpretation of the message as we work out what the advertiser intended us to understand. We are actively involved in creating an interpretation of what we read and hear.

In our discussion of the last two examples, we emphasized the influence of context. There are different kinds of context. There is obviously the *physical context*, which can be the location “out there” where we encounter words and phrases (e.g. the word *BANK* on a
wall of a building is understood as a financial institution). There is also the linguistic context, also known as co-text. The co-text of a word is the set of other words used in the same phrase or sentence. If the word bank is used with other words like steep or overgrown, we have no problem deciding which type of bank is meant. Or, when someone says that she has to get to the bank to withdraw some cash, the co-text tells us which type of bank is intended.
Deixis

There are some very common words in our language that can’t be interpreted at all if we don’t know the context. These are words such as here and there, this or that, now or then, yesterday, today or tomorrow, as well as pronouns such as you, me, she, him, it, them. Some sentences of English are virtually impossible to understand if we don’t know who is speaking, about whom, where and when. For example, what is the meaning of: You’ll have to bring it back tomorrow because she isn’t here today?

Out of context, this sentence is really vague. It contains a large number of expressions (you, it, tomorrow, she, here, today) that rely on knowledge of the local context for their interpretation. In context, we are expected to understand that the delivery driver (you) will have to return on February 15th (tomorrow) to 660 College Drive (here) with the long box (it) labeled “flowers, handle with care” addressed to Lisa Landry (she). For more examples, see Tasks C and D on page 151.

Expressions such as tomorrow and here are technically known as deictic (/deɪɪktɪk/) expressions, from the Greek word deixis, which means “pointing” via language. We use deixis to point to people (us, them, those idiots), places (here, over there) and times (now, last week). All these deictic expressions are interpreted in terms of which person, place or time the speaker has in mind. As shown in Table 10.1, we also make a broad distinction between what is close to the speaker (this, here, now) and what is distant or not close to the speaker (that, there, then).

Table 10.1

<table>
<thead>
<tr>
<th>Close to speaker</th>
<th>Not close to speaker</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person deixis</td>
<td>me, us, ours, this girl</td>
</tr>
<tr>
<td>Spatial deixis</td>
<td>here, this bed, behind me</td>
</tr>
<tr>
<td>Temporal deixis</td>
<td>now, today, this morning</td>
</tr>
</tbody>
</table>

This distinction may also be used to express emotions. If something is close, but we don’t like it, we can use a “not close” term to describe it, thereby pushing it away from us.
by using deixis. A large bowl of cold tomato soup (which you hate) is placed in front of you (so it is close), but you find yourself saying, *I can’t eat that.*

We can also indicate whether movement is away from the speaker (*go*) or toward the speaker (*come*). Just think about the difference between telling someone to *Go to bed* versus *Come to bed*. Deixis can even be entertaining. The bar owner who puts up a big sign that reads *Free Beer Tomorrow* (to get you to return to the bar) can always claim that you are just one day too early for the free drink.
Reference

In discussing deixis, we assumed that the use of words to refer to people, places and times was a simple matter. However, words themselves don’t refer to anything. People refer. We have to define reference as an act by which a speaker (or writer) uses language to enable a listener (or reader) to identify something. To perform an act of reference, we can use proper nouns (Chomsky, Jennifer, Whiskas), other nouns in phrases (a writer, my friend, the cat) or pronouns (he, she, it). We sometimes assume that these words identify someone or something uniquely, but it is more accurate to say that, for each word or phrase, there is a “range of reference.” The words Jennifer or friend or she can be used to refer to many entities in the world. As we observed earlier, an expression such as the war doesn’t directly identify anything by itself, because its reference depends on who is using it.

We can also refer to things when we are not sure what to call them. We can use expressions such as the blue thing and that icky stuff and we can even invent names. For instance, there was a man who always drove his motorcycle fast and loud through my neighborhood and was locally referred to as Mr. Kawasaki. In this case, a brand name for a motorcycle is being used to refer to a person.
Inference

As in the “Mr. Kawasaki” example, a successful act of reference depends more on the listener/reader’s ability to recognize what the speaker/writer means than on the listener’s “dictionary” knowledge of a word that is used. For example, in a restaurant, one waiter can ask another, *Where’s the spinach salad sitting?* and receive the reply, *He’s sitting by the door.* If you’re studying linguistics, you might ask someone, *Can I look at your Chomsky?* and get the response, *Sure, it’s on the shelf over there.* And when you hear that *Jennifer is wearing Calvin Klein,* you avoid imagining someone called Calvin draped over poor Jennifer and recognize that they are talking about her clothing.

These examples make it clear that we can use nouns associated with things (*salad*) to refer to people, and use names of people (*Chomsky, Calvin Klein*) to refer to things. The key process here is called inference. An inference is additional information used by the listener to create a connection between what is said and what must be meant. In the *Chomsky* example, the listener has to operate with the inference: “if X is the name of the writer of a book, then X can be used to identify a copy of a book by that writer.” Similar types of inferences are necessary to understand someone who says that *Picasso is in the museum, We saw Shakespeare in London, Mozart was playing in the background* and *The bride wore Giorgio Armani.*
Anaphora

We usually make a distinction between how we introduce new referents (a puppy) and how we refer back to them (the puppy, it).

*We saw a funny home video about a boy washing a puppy in a small bath.*

The puppy started struggling and shaking and the boy got really wet.

When he let go, it jumped out of the bath and ran away.

In this type of referential relationship, the second (or subsequent) referring expression is an example of anaphora (“referring back”). The first mention is called the antecedent. So, in our example, a boy, a puppy and a small bath are antecedents and The puppy, the boy, he, it and the bath are anaphoric expressions.

There is a much less common pattern, called cataphora, which reverses the antecedent–anaphora relationship by beginning with a pronoun (It), then later revealing more specific information. This device is more common in stories, as in this beginning: *It suddenly appeared on the path a little ahead of me, staring in my direction and sniffing the air. An enormous grizzly bear was checking me out.*

Anaphora is, however, the more common pattern and can be defined as subsequent reference to an already introduced entity. Mostly we use anaphora in texts to maintain reference. The connection between an antecedent and an anaphoric expression is created through a pronoun (it), or a phrase with the plus the antecedent noun (the puppy), or another noun that is related to the antecedent in some way (The little dog ran out of the room). The connection between antecedents and anaphoric expressions is often based on inference, as in these examples:

*We found a house to rent, but the kitchen was very small.*

*I got on a bus and asked the driver if it went near the downtown area.*

In the first example, we must make an inference like “if X is a house, then X has a kitchen” in order to interpret the connection between antecedent a house and anaphoric expression the kitchen. In the second example, we must make an inference like “if X is a bus, then X has a driver” in order to make the connection between a bus and the driver. In some cases, the antecedent can be a verb, as in: *The victim was shot twice, but the gun was never recovered.* Here the inference is that any “shooting” event must involve a gun.
We have used the term “inference” here to describe what the listener (or reader) does. When we talk about an assumption made by the speaker (or writer), we usually talk about a “presupposition.”
Presupposition

When we use a referring expression like *this, he* or *Jennifer*, we usually assume that our listeners can recognize which referent is intended. In a more general way, we design our linguistic messages on the basis of large-scale assumptions about what our listeners already know. What a speaker (or writer) assumes is true or known by a listener (or reader) can be described as a presupposition.

If someone tells you *Hey, your brother is looking for you*, there is an obvious presupposition that you have a brother. If you are asked the question *When did you stop smoking?*, there are at least two presuppositions involved: you used to smoke and you no longer do so. There is a test for presuppositions that involves comparing a sentence with its negative version and identifying which presuppositions remain true in both. This is called “constancy under negation.” Whether you say *My car is a wreck* or the negative *My car is not a wreck*, there is an underlying presupposition (*I have a car*) that remains true. For more examples, see Task G on pages 152–153.
Pragmatic Markers

Speakers have other ways of indicating how their utterances are to be interpreted. They can include short forms such as you know, well, I mean, I don’t know, which are optional and loosely attached to the utterance. These are pragmatic markers and they can be used to mark a speaker’s attitude to the listener or to what is being said. Speakers can use you know to indicate that knowledge is being treated as shared, and I mean to self-correct or to mark an attempt to clarify something.

They had been reading something by Charles Wright, you know, the famous poet and well, I mean, he’s famous in America at least, but em they didn’t really understand it.

After making a statement about the poet, the speaker uses well to mark a shift from conveying information to commenting on it, with I mean introducing a clarification.

A more recent change of function has turned I don’t know into a pragmatic marker. This phrase has evolved from a way of indicating lack of knowledge (What’s a lychee? - I don’t know) to become a marker of hesitation or uncertainty when a speaker is about to say something potentially in disagreement with another speaker.

LEE: I’m not very fond of Edinburgh it’s so drab and it’s always cold there.

JEN: Oh, I don’t know, I really enjoyed going to the Festival there last year.

By appearing hesitant about disagreeing, the speaker can signal a desire not to challenge the other speaker. It seems to be a new way of being polite in interaction.
Politeness

We can think of politeness in general terms as having to do with ideas like being tactful, modest and nice to other people. In the study of linguistic politeness, the most relevant concept is “face.” Your face, in pragmatics, is your public self-image. This is the emotional and social sense of self that everyone has and expects everyone else to recognize. Politeness can be defined as showing awareness and consideration of another person’s face.

If you say something that represents a threat to another person’s self-image, that is called a face-threatening act. For example, if you use a direct command to get someone to do something (Give me that paper!), you are behaving as if you have more social power than the other person. If you don’t actually have that social power (e.g. you are not a military officer or prison warden), then you are performing a face-threatening act. An indirect request, in the form associated with a question (Could you pass me that paper?), removes the assumption of social power. You are only asking if it is possible. This makes your request less threatening to the other person’s face. Whenever you say something that lessens the possible threat to another’s face, it can be described as a face-saving act.
Negative and Positive Face

We have both a negative face and a positive face. (Note that “negative” doesn’t mean “bad” here, it is simply the opposite of “positive.”) **Negative face** is the need to be independent and free from imposition. **Positive face** is the need to be connected, to belong, to be a member of the group. So, a face-saving act that emphasizes a person’s negative face will show concern about imposition (*I’m sorry to bother you …; I know you’re busy, but …*). A face-saving act that emphasizes a person’s positive face will show solidarity and draw attention to a common goal (*The same thing happened to me …; Let’s do this together …*).

Ideas about the appropriate language to mark politeness differ substantially from one culture to the next. If you have grown up in a culture that has directness as a valued way of showing solidarity, and you use direct commands (*Give me that chair!* to people whose culture is more oriented to indirectness and avoiding direct imposition, then you will be considered impolite. You, in turn, may think of the others as vague and unsure of whether they really want something or are just asking questions about it (*Are you using this chair?*). In either case, it is the pragmatics that is misunderstood and, unfortunately, more will often be communicated than is said.

The distinction between direct and indirect ways of communicating can be analyzed as different types of linguistic action, or speech acts.
Speech Acts

We use the term speech act to describe an action that involves language such as “requesting,” “commanding,” “questioning” or “informing.” To take a more specific example, if you say, *I’ll be there at six*, you are not just uttering a sentence, you seem to be performing the speech act of “promising.” We can define a speech act as the action performed by a speaker with an utterance. (See Task E, page 152, for more.)

In order to understand how utterances can be used to perform actions that are both direct and indirect, we need to visualize a relationship between the structure of an utterance and the normal function of that utterance, as in Table 10.2.

<table>
<thead>
<tr>
<th></th>
<th>Structures</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Did you eat the pizza?</em></td>

<td><em>Eat the pizza (please)!</em></td>
<td>Imperative</td>
<td>Command (Request)</td>
</tr>
<tr>
<td><em>You ate the pizza.</em></td>
<td>Declarative</td>
<td>Statement</td>
</tr>
</tbody>
</table>
Direct and Indirect Speech Acts

When an interrogative structure such as *Did you … ?*, *Is she … ?* or *Can you … ?* is used with the function of a question, it is described as a direct speech act. When you seriously want to know the answer to *Is she wearing a wig?*, that utterance is a direct speech act. If we really don’t know something and we ask for the information (e.g. about ability), we normally use a direct speech act, as in *Can you ride a bicycle?*.

Compare that utterance with *Can you pass the salt?*. In this second example, we are not really asking a question about someone’s ability. We are using an interrogative structure to make a request. This is an example of an indirect speech act. Whenever one of the structures in Table 10.2 is used to perform a function other than the one listed beside it on the same line, the result is an indirect speech act. For example, you can also use a declarative structure (*You left the door open*) to make a request (to the person, who just came in from the chilly outside, to close it). That is another indirect speech act.

Indirect speech acts offer fairly good evidence in support of the pragmatic principle, stated earlier, that communication depends on not only recognizing the structure and meaning of words in an utterance, but also recognizing what speakers mean by their utterances in a particular context. We will encounter more examples of this principle at work in Chapter 11.
Study Questions

1 What kinds of deictic expressions are used here (e.g. \textit{We} = person deixis)?
   (a) We went \textit{there} last summer.
   (b) I’m busy now so you can’t stay \textit{here}. Come back later.

2 How do we describe the pragmatic difference between the pair \textit{here} and \textit{now} versus \textit{there} and \textit{then}? 

3 What kind of inference is involved in interpreting each of these utterances?
   (a) \textit{Teacher}: You can borrow my \textit{Shakespeare}.
   (b) \textit{Waiter}: The ham sandwich left without paying.
   (c) \textit{Nurse}: The hernia in room 5 wants to talk to the doctor.
   (d) \textit{Dentist}: My eleven-thirty canceled so I had an early lunch.

4 What are the anaphoric expressions in the following sentence?
   Dr. Foster gave Andy some medicine after he told her about his headaches and she advised him to take the pills three times a day until the pain went away.

5 What is the technical term for the phrase \textit{an old car} in its relationship with \textit{it} in the following utterance?
   I have an old car, but it runs great.

6 What is one obvious presupposition of a speaker who says:
   (a) Your clock isn’t working.
   (b) Where did he find the money?
   (c) We regret buying that car.
   (d) The king of France is bald.

7 How many pragmatic markers are used in the following interaction?
   \textit{Mana}: Why does everyone think he’s a genius, I mean, he gets things wrong like the rest of us, doesn’t he?
MAKA: Well, I don’t know, he got that award last year for innovation, you know, the Brill award, at the convention in New York, I think it was.

8 In these examples, is the speaker appealing to positive or negative face?

(a) If you’re free, there’s going to be a party at Yuri’s place on Saturday.

(b) Let’s go to the party at Yuri’s place on Saturday. Everyone’s invited.

9 Someone stands between you and the TV set you’re watching, so you decide to say one of the following. Identify which would be direct or indirect speech acts.

(a) Move!
(b) You’re in the way.
(c) Could you please sit down?
(d) Please get out of the way.

10 In terms of speech acts, how would you explain the unusual nature of this interaction between a visitor to a city, with luggage, looking lost, and a man in the street outside the railway station.

VISITOR: Excuse me. Do you know where the Ambassador Hotel is?

RESIDENT: Oh sure, I know where it is. (and walks away)
Tasks

A What do you think is meant by the statement: “A context is a psychological construct” (Sperber and Wilson, 1995)?

B What is metapragmatics? What aspects of the following utterance illustrate metapragmatic awareness?

I know that Justin said, “I’ll help you, darling,” but he wasn’t actually promising anything, I’m sure.

C Why is the concept of “deictic projection” necessary for the analysis of the following deictic expressions?

1. On a telephone answering machine: I am not here now
2. On a map/directory: YOU ARE HERE
3. Watching a horse race: Oh, no. I’m in last place.
4. In a car that won’t start: Maybe I’m out of gas.
5. Pointing to an empty chair in class: Where is she today?

D Spatial deixis can be marked with affixes on verbs in Lolovoli (spoken on Ambae Island in the Republic of Vanuatu, in the south-west Pacific). The verbs that are used to describe the direction of movement are also deictic. Look at the following examples (based on Hyslop, 2001) and try to answer the questions that follow.

(i) Can you complete the set of verb forms in (6)–(9)?

(ii) What distinction is coded in the two affixes used for spatial deixis?

(iii) Can you think of a reason for the distinctions in direction of movement, as coded in the verbs?

E Which of these utterances contain “performative verbs” and how did you decide?

(1) I apologize.

(2) He said he was sorry.

(3) I bet you $20.

(4) She won the bet.

(5) I drive a Mercedes.

(6) You must have a lot of money.

F The following phrases were all on signs advertising sales. What other words would you add to the description to make it clearer? What is the underlying structure of each phrase? For example, Furniture Sale means “someone is selling furniture.” Would the same structure be appropriate for Garage Sale?

G Certain types of question–answer jokes or riddles seem to depend for their effect on the reanalysis of a presupposition in the question after the answer is given. For example, in the question What two things can you never eat before breakfast?, the phrase two things invites an
interpretation that presupposes two “specific things,” such as individual food items, as objects of the verb *eat*. When you hear the answer *Lunch and dinner*, you have to replace the first presupposition with another assuming two “general things,” not individual food items, as objects of *eat*.

Can you identify the reanalyzed presuppositions involved in the following jokes (from Ritchie, 2002)?

(1) **Q:** Why do birds fly south in the winter?
   **A:** Because it’s too far to walk.

(2) **Q:** Do you believe in clubs for young people?
   **A:** Only when kindness fails.

(3) **Q:** Did you know that in New York someone is knocked down by a car every ten minutes?
   **A:** No, but I imagine he must be getting really tired of it.

(4) In a clothing store, a customer asks a salesperson:

   **Q:** Can I try on that dress in the window?
   **A:** Well, maybe it would be better to use the dressing room.

Deictic expressions are not the only examples of vague language that require a pragmatic interpretation. All the following expressions are vague in some way. Can you analyze them into the categories in the chart below, which is based on Overstreet (2011: 298)? Can you add other examples?

<table>

I Using these examples, and any others you think are appropriate, try to decide if euphemisms and proverbs should be studied as part of pragmatics. Are they, for example, similar to indirect speech acts?

(1) *She’s got a bun in the oven.*

(2) *He’s gone to a better place.*

(3) *Unfortunately, there was some collateral damage.*

I On the topic of “more gets communicated than is said,” consider this situation, described in Tannen (2005):

A Greek woman explained how she and her father (and later her husband) communicated. If she wanted to do something, like go to a dance, she had to ask her father for permission. He never said no. But she could tell from the way he said yes whether or not he meant it. If he said something like “Yes, of course, go,” then she knew he thought it was a good idea. If he said something like “If you want, you can go,” then she understood that he didn’t think it was a good idea, and she wouldn’t go.

(i) Why do you think “he never said no” (when he was communicating “No”)?

(ii) How would you analyze the two speech acts reported as responses in this passage?

(iii) Are you familiar with any other comparable situations where “more is communicated than is said”?

(For background reading, see Tannen, 2005.)

II What counts as polite behavior can differ substantially from one group or culture to the next. Below are some basic descriptions from Lakoff (1990) of three types of politeness, called distance politeness, deference politeness and camaraderie politeness. As you read these descriptions, try to decide which type you are most familiar with and whether you have encountered the others on any occasion. What kind of language do you think is characteristic of these different types of politeness?

(1) “Distance politeness is the civilized human analogue to the territorial strategies of other animals. An animal sets up physical boundary markers (the dog and the hydrant) to signal its fellows: My turf, stay out. We, being symbol-using creatures, create symbolic fences.”

“Distancing cultures weave remoteness into their language.”

(2) “Another culture might avoid the danger of conflict by adopting a strategy of deferential politeness. If a participant decides that whatever is to happen in a conversation – both what is said and it is to mean – is up to the other person, conflict can easily be avoided.”
“Where distance politeness more or less assumes equality between participants, deference works by debasing one or both.”

“While distance politeness has been characteristic of the middle and upper classes in most of Europe for a very long time, deference has been typical in many Asian societies. But it is also the preferred model of interaction for women in the majority of societies, either always or only when talking to men.”

(3) “A third strategy (camaraderie) that has recently emerged in this culture makes a different assumption: that interaction and connection are good in themselves, that openness is the greatest sign of courtesy.”

“In a camaraderie system, the appearance of openness and niceness is to be sought above all else. There is no holding back, nothing is too terrible to say.”

There’s two types of favors, the big favor and the small favor. You can measure the size of the favor by the pause that a person takes after they ask you to “Do me a favor.”

Small favor – small pause. “Can you do me a favor, hand me that pencil.” No pause at all. Big favors are, “Could you do me a favor …” Eight seconds go by. “Yeah? What?” “… well.” The longer it takes them to get to it, the bigger the pain it’s going to be.

Humans are the only species that do favors. Animals don’t do favors. A lizard doesn’t go up to a cockroach and say, “Could you do me a favor and hold still, I’d like to eat you alive.” That’s a big favor even with no pause.

Seinfeld (1993)
In the study of language, some of the most interesting observations are made, not in terms of the components of language, but in terms of the way language is used, even how pauses are used, as in Jerry Seinfeld’s commentary. We have already considered some of the features of language in use when we discussed pragmatics in Chapter 10. We were, in effect, asking how it is that language-users successfully interpret what other language-users intend to convey. When we carry this investigation further and ask how we make sense of what we read, how we can recognize well-constructed texts as opposed to those that are jumbled or incoherent, how we understand speakers who communicate more than they say, and how we successfully take part in that complex activity called conversation, we are undertaking what is known as discourse analysis.
Discourse

The word discourse is usually defined as “language beyond the sentence” and so the analysis of discourse is typically concerned with the study of language in texts and conversation. In many of the preceding chapters, when we were concentrating on linguistic description, we were concerned with the accurate representation of the forms and structures. However, as language-users, we are capable of more than simply recognizing correct versus incorrect forms and structures. We can cope with fragments in newspaper headlines such as Trains collide, two die, and know that what happened in the first part was the cause of what happened in the second part. We can also make sense of notices like No shoes, no service, on shop windows in summer, understanding that a conditional relation exists between the two parts (“If you are wearing no shoes, you will receive no service”). We have the ability to create complex discourse interpretations of fragmentary linguistic messages.
Interpreting discourse

We can even cope with texts, written in English, which we couldn’t produce ourselves and which appear to break a lot of the rules of the English language. Yet we can build an interpretation. The following example, provided by Eric Nelson, is from an essay by a student learning English and contains ungrammatical forms and misspellings, yet it can be understood.

*My Town*

*My natal was in a small town, very close to Riyadh capital of Saudi Arabia. The distant between my town and Riyadh 7 miles exactly. The name of this Almasani that means in English Factories. It takes this name from the people’s carrer. In my childhood I remmeber the people live. It was very simple. Most the people was farmer.*

This example may serve to illustrate a simple point about the way we react to language that contains ungrammatical forms. Rather than simply rejecting the text as ungrammatical, we try to make sense of it. That is, we attempt to arrive at a reasonable interpretation of what the writer intended to convey. (Most people say they understand the “My Town” text quite easily.)

It is this effort to interpret (or to be interpreted), and how we accomplish it, that are the key elements investigated in the study of discourse. To arrive at an interpretation, and to make our messages interpretable, we certainly rely on what we know about linguistic form and structure. But, as language-users, we have more knowledge than that.
Cohesion

We know, for example, that texts must have a certain structure that depends on factors quite different from those required in the structure of a single sentence. Some of those factors are described in terms of cohesion, or the formal ties and connections that exist within texts. There are several cohesive ties in this text.

*My father once bought a Lincoln convertible. He did it by saving every penny he could. That car would be worth a fortune nowadays. However, he sold it to help pay for my college education. Sometimes I think I'd rather have the convertible.*

We can identify connections here in the use of words to maintain reference to the same people and things throughout. There are also connections created by terms that share a common element of meaning, such as “money” and “time.” The verb tenses in the first four sentences are in the past, creating a connection between those events, in contrast to the present tense of the final sentence marking a change in time and focus. These cohesive ties are listed in Table 11.1.

<table>
<thead>
<tr>
<th>Table 11.1</th>

<tbody>
<tr>
<td>People</td>
</tr>
<tr>
<td>Things</td>
</tr>
<tr>
<td>Money</td>
</tr>
<tr>
<td>Time</td>
</tr>
<tr>
<td>Tenses</td>
</tr>
</tbody>
</table>

Analysis of these cohesive ties gives us some insight into how writers structure what they want to say. However, by itself, cohesion is not sufficient to enable us to make sense of what we read. It is quite easy to create a text that has a lot of cohesive ties, but is difficult to interpret. Note that the following text has these connections in Lincoln – the car, red – that color, her – she and letters – a letter.
My father bought a Lincoln convertible. The car driven by the police was red. That color doesn’t suit her. She consists of three letters. However, a letter isn’t as fast as a telephone call.

It becomes clear from this type of example that the “connectedness” we experience in our interpretation of normal texts is not simply based on connections between words. There must be another factor that helps us distinguish connected texts that make sense from those that do not. This factor is usually described as “coherence.”
Coherence

The key to the concept of coherence (“everything fitting together well”) is not something that exists in the words or structures of discourse, like cohesion, but something that exists in people. It is people who “make sense” of what they read and hear. They try to arrive at an interpretation that is in line with their experience of the way the world is. You may have tried quite hard to make the last example fit some situation that accommodated all the details (involving a red car, a woman and a letter) into a single coherent interpretation. In doing so, you would necessarily be involved in a process of bringing other information to the text. This process is not restricted to trying to understand “odd” texts. It seems to be involved in our interpretation of all discourse.

For example, you pick up a newspaper and see this headline: *Woman robs bank with sandwich*. As you try to build a coherent interpretation, you probably focus on the *sandwich* part because there is something odd about this situation. Is she just carrying a sandwich, or is she eating the sandwich (taking occasional bites), or is she acting as if the sandwich is a weapon (concealed in a bag perhaps)? Deciding which interpretation is appropriate cannot be accomplished based on only the words in the headline. We need to bring information from our experience to create a plausible situation. If you decided on the “pretend gun in bag” situation, then your coherence-creating mind would appear to be in good working order.

We also depend on coherence in coping with everyday conversation. We are continually taking part in conversational interactions where a great deal of what is meant or communicated cannot actually be found in what is said. In this brief interaction (from Widdowson, 1978), there are no cohesive ties connecting the three utterances, so we must be using some other means to make sense of it. One way to understand what is going on is to consider the three parts of the interaction in terms of speech acts (introduced in Chapter 10). These are listed on the right, providing a way of analyzing the interaction by identifying what makes it coherent for the participants.

| HER: *That's the telephone.* | (She makes a request of him to perform action) |
| HIM: *I'm in the bath.* | (He states reason why he cannot comply with request) |
| HER: *OK.* | (She accepts reason) |
If this is a reasonable analysis of what took place in the brief interaction, then it is clear that language-users must have a lot of knowledge of how conversation works that is not simply knowledge of words and sentences, but must involve familiarity with a lot of other types of structures and their typical functions.
Conversation analysis

In simple terms, English conversation can be described as an activity in which, for the most part, two or more people take turns at speaking. Typically, only one person speaks at a time and there tends to be an avoidance of silence between speaking turns. (This is not true in all situations or societies.) If more than one participant tries to talk at the same time, one of them usually stops, as in the following example, where A stops until B has finished.

A: Didn’t you [know wh-
B: [But he must’ve been there by two
A: Yes but you knew where he was going

(A small square bracket [ is conventionally used to indicate a place where simultaneous or overlapping speech occurs.)

For the most part, participants wait until one speaker indicates that he or she has finished, usually by signaling a completion point. Speakers can mark their turns as complete in a number of ways: by asking a question, for example, or by pausing at the end of a completed syntactic structure like a phrase or sentence. Other participants can indicate that they want to take the speaking turn, also in a number of ways. They can start to make short sounds, usually repeated, while the speaker is talking, and often use body shifts or facial expressions to signal that they have something to say. (For more on conversation, see Task C, on page 168.)
Turn-Taking

There are different expectations of conversational style and different strategies of participation in conversation, which may result in slightly different conventions of turn-taking. One strategy, which may be overused by “long-winded” speakers or those who are used to “holding the floor,” is designed to avoid having normal completion points occur. We all use this strategy to some extent, usually in situations where we have to work out what we are trying to say while actually saying it.

If the normal expectation is that completion points are marked by the end of a sentence and a pause, then one way to “keep the turn” is to avoid having those two markers occur together. That is, don’t pause at the end of sentences; make your sentences run on by using connectors like and, and then, so, but; place your pauses at points where the message is clearly incomplete; and preferably “fill” the pause with a hesitation marker such as er, em, uh, ah.
Pauses and Filled Pauses

In the following example, note how the pauses (marked by …) are placed before and after verbs rather than at the end of sentences, making it difficult to get a clear sense of what this person is saying until we hear the part after each pause.

A: that's their favorite restaurant because they … enjoy French food and when they were … in France they couldn't believe it that … you know that they had … that they had had better meals back home

In the next example, speaker X produces filled pauses (with em, er, you know) after having almost lost the turn at his first brief hesitation.

X: well that film really was … [wasn’t what he was good at

Y: [when di-

X: I mean his other … em his later films were much more … er really more in the romantic style and that was more what what he was … you know … em best at doing

Y: so when did he make that one
Adjacency Pairs

That last example would seem to suggest that conversation is a problematic activity where speakers have to pay close attention to what is going on. That is not normally the case because a great deal of conversational interaction follows some fairly well established patterns. When someone says *Hi* or *Hello*, we usually respond with a similar greeting. This type of almost automatic sequence is called an adjacency pair, which consists of a first part and a second part, as found in greetings, question–answer (Q–A) sequences, thanking and leave-taking.

<table>
<thead>
<tr>
<th>First part</th>
<th>Second part</th>
</tr>
</thead>
<tbody>
<tr>
<td>YOU: Good mornin’.</td>
<td>ME: Good mornin’.</td>
</tr>
<tr>
<td>YOU: Where’s Mary?</td>
<td>ME: She’s at work already.</td>
</tr>
<tr>
<td>YOU: Thanks for your help yesterday.</td>
<td>ME: Oh, you’re welcome.</td>
</tr>
<tr>
<td>YOU: Okay, talk to you later.</td>
<td>ME: Bye.</td>
</tr>
</tbody>
</table>

These examples illustrate the basic pattern, but not all first parts are immediately followed by second parts. For example, one question may not receive its answer until after another question–answer sequence. (See Task E, on page 169, for more.)
Insertion Sequences

In the following example, the sequence Q2–A2 comes between the first question (Q1) and its answer (A1). This is called an insertion sequence, that is, an adjacency pair that comes between the first and second parts of another pair.

**YOU:** Do you want some milk?  
**ME:** Is it soy milk?  
**YOU:** Of course.  
**ME:** Okay, thanks.

In some situations, a complex structure can emerge from the effect of insertion sequences. This is often the case in “service encounters,” as in our next example. Notice how it is only in the middle of this interaction (Q3–A3) that we have an adjacency pair together, while insertion sequences delay the occurrence of second parts for each of the other first parts.

**BUD:** Can I order pizza to go?  
**DAN:** What kind would you like?  
**BUD:** Do you have any special deals?  
**DAN:** Well, you can get two veggie supremes for the price of one.  
**BUD:** Okay, I’d like that deal.  
**DAN:** Sure thing. We’ll have that ready for you in no time.

We are not normally aware of most of these aspects of conversational structure, but speakers sometimes draw attention to the need for a second part once a first part has been uttered. In the following interaction, originally analyzed by Sacks (1972: 341), a mother immediately notices the absence of a spoken return greeting by her daughter and draws attention to the social expectation involved.

**WOMAN:** Hi, Annie.
Mother: Annie, don’t you hear someone say hello to you?

Woman: Oh, that’s okay, she smiled hello.

Mother: You know you’re supposed to greet someone, don’t you?

Annie: [Hangs head] Hello.

The expectations we all have that certain patterns of turn-taking will occur in conversation are connected to a more general aspect of socially situated interaction, that it will be “co-operative.” This observation is actually a principle of conversation.
The Co-operative Principle

An underlying assumption in most conversational exchanges is that the participants are co-operating with each other. This principle, plus four elements, or “maxims,” were first described by the philosopher Paul Grice (1975: 45), and are often referred to as the “Gricean maxims,” as presented in Table 11.2.

Table 11.2

<table>
<thead>
<tr>
<th>The Co-operative Principle</th>
<th>Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Quantity maxim</td>
<td>Make your contribution as informative as is required, but not more, or less, than is required.</td>
</tr>
<tr>
<td>The Quality maxim</td>
<td>Do not say that which you believe to be false or for which you lack adequate evidence.</td>
</tr>
<tr>
<td>The Relation maxim</td>
<td>Be relevant.</td>
</tr>
<tr>
<td>The Manner maxim</td>
<td>Be clear, brief and orderly.</td>
</tr>
</tbody>
</table>

In simple terms, we expect our conversational partners to make succinct, honest, relevant and clear contributions to the interaction and to signal to us in some way if these maxims are not being followed. It is certainly true that, on occasion, we can experience conversational exchanges in which the co-operative principle may not seem to be in operation. However, this general description of the normal expectations we have in conversation helps to explain a number of regular features in our talk. For example, during their lunch break, one woman asks another how she likes the sandwich she is eating and receives the following answer.

*Oh, a sandwich is a sandwich.*

In logical terms, this reply appears to have no communicative value since it states something obvious and hence would appear to be a *tautology*. Repeating a phrase that adds nothing would hardly count as an appropriate answer to a question. However, if the woman is being co-operative and adhering to the Quantity maxim about being “as
informative as is required,” then the listener must assume that her friend is communicating something. Given the opportunity to evaluate the sandwich, her friend has responded without an explicit evaluation, thereby implying that she has no opinion, good or bad, to express. That is, her friend has communicated that the sandwich is not worth talking about. (See Task D, on page 169, for more.)
Hedges

We can use certain types of expressions, called hedges, to show that we are concerned about following the maxims while being co-operative speakers. Hedges can be defined as words or phrases used to indicate that we are not really sure that what we are saying is sufficiently correct or complete. We can use sort of or kind of as hedges on the accuracy of our statements, as in descriptions such as *His hair was kind of long* or *The book cover is sort of yellow*. These are examples of hedges on the Quality maxim. Other examples would include the following expressions that people sometimes use as they begin a conversational contribution.

\[As \text{ far } \text{ as I know} \ldots\]

\[Correct \text{ me if I’m wrong, but } \ldots\]

\[I’m \text{ not absolutely sure, but } \ldots\]

We also take care to indicate that what we report is something we think or feel (not know), is possible (not certain), and may (not must) happen. Hence the difference between saying *Jackson is guilty* and *I think it’s possible that Jackson may be guilty*. In the first version, people will assume you have very good evidence for the statement.
Implicatures

When we try to analyze how hedges work, we usually talk about speakers implying something that is not said. Similarly, in considering what the woman meant by *a sandwich is a sandwich*, we decided that she was implying that the sandwich was not worth talking about. With the co-operative principle and the maxims as guides, we can start to work out how people actually decide that someone is “implying” something in conversation. Consider the following example.

**Carol:** Are you coming to the party tonight?

**Lara:** I’ve got an exam tomorrow.

On the face of it, Lara’s statement is not an answer to Carol’s question. Lara doesn’t say *Yes* or *No*. Yet Carol will interpret the statement as meaning “No” or “Probably not.” How can we account for this ability to grasp one meaning from a sentence that, in a literal sense, means something else? It seems to depend on the assumption that Lara is being relevant (Relation) and informative (Quantity). Given that Lara’s original answer contains relevant information, Carol can work out that “exam tomorrow” involves “study tonight,” and “study tonight” precludes “party tonight.” Thus, Lara’s answer is not just a statement about tomorrow’s activities, it contains an *implicature* (an additional conveyed meaning) concerning tonight’s activities.
Background Knowledge

It is noticeable that, in order to analyze the conversational implicature involved in Lara’s statement, we had to describe some background knowledge (about exams, studying and partying) that must be shared by the conversational participants. Investigating how we use our background knowledge to arrive at interpretations of what we hear and read is a critical part of doing discourse analysis.

The processes involved in using background knowledge can be illustrated in the following exercise (from Sanford and Garrod, 1981). Begin with these sentences:

*John was on his way to school last Friday.*

*He was really worried about the math lesson.*

Most readers report that they think John is probably a schoolboy. Since this piece of information is not directly stated in the text, it must be an inference. Other inferences, for different readers, are that John is walking or that he is on a bus. These inferences are clearly derived from our conventional knowledge, in our culture, about “going to school,” and no reader has ever suggested that John is swimming or on a boat, though both are physically possible interpretations.

An interesting aspect of the reported inferences is that readers can quickly abandon them if they do not fit in with some subsequent information.

*Last week he had been unable to control the class.*

On encountering this sentence, most readers decide that John must be a teacher and that he is not very happy. Many report that he is probably driving a car to school.

*It was unfair of the math teacher to leave him in charge.*

Suddenly, John reverts to his schoolboy status, and the inference that he is a teacher is quickly abandoned. The final sentence of the text contains a surprise.

*After all, it is not a normal part of a janitor’s duties.*

This type of text and manner of presentation, one sentence at a time, is rather artificial, of course. Yet the exercise does provide us with some insight into the ways in which we
“build” interpretations of what we read by using more information than is presented in the words on the page. We actually create what the text is about, based on our expectations of what normally happens. To describe this phenomenon, researchers often use the concept of a “schema” or a “script.”
Schemas and Scripts

A **schema** is a general term for a conventional knowledge structure that exists in memory. We were using our conventional knowledge of what a school classroom is like, or a “classroom schema,” as we tried to make sense of the previous example. We have many schemas (or schemata) that are used in the interpretation of what we experience and what we hear or read about. If you hear someone describe what happened during a visit to a supermarket, you don’t have to be told what is in a supermarket. You already have a “supermarket schema” (food displayed on shelves, arranged in aisles, shopping carts and baskets, check-out counter and so on).

Similar in many ways to a schema is a **script**. A script is essentially a dynamic schema. That is, instead of the set of typical fixed features in a schema, a script has a series of conventional actions that take place. You have a script for “Going to the dentist” and another script for “Going to the movies.” We all have versions of an “Eating in a restaurant” script, which we can activate to make sense of this text.

*Trying not to be out of the office for long, Suzy went into the nearest place, sat down and ordered an avocado sandwich. It was quite crowded, but the service was fast, so she left a good tip. Back in the office, things were not going well.*

On the basis of our restaurant script, we would be able to say a number of things about the scene and events briefly described in this short text. Although the text doesn’t have this information, we would assume that Suzy opened a door to get into the restaurant, that there were tables there, that she ate the sandwich, then she paid for it and so on. The fact that information of this type can turn up in people’s attempts to remember the text is further evidence of the existence of scripts. It is also a good indication of the fact that our understanding of what we read doesn’t come directly from what words and sentences are on the page, but the interpretations we create, in our minds, of what we read.

Indeed, information is sometimes omitted from instructions on the assumption that everybody knows the script. This instruction is from a bottle of cough syrup.

*Fill measure cup to line and repeat every 2 to 3 hours.*

No, you’ve not just to keep filling the measure cup every 2 to 3 hours. Nor have you to rub the cough syrup on your neck or in your hair. You are expected to know the script and
drink the stuff from the measure cup every 2 or 3 hours.

Clearly, our understanding of what we read is not only based on what we see on the page (language structures), but also on other things that we have in mind (knowledge structures) as we go about making sense of discourse.

Tasks

A In the analysis of discourse, what is “intertextuality”? 

B

(i) Identify the main cohesive ties in this first paragraph of a novel (Faulkner, 1929).

(ii) What do you think “they” were hitting?

Through the fence, between the curling flower spaces, I could see them hitting. They were coming toward where the flag was and I went along the fence. Luster was hunting in the grass by the flower tree. They took the flag out, and they were hitting. Then they put the flag back and they went to the table, and he hit and the other hit. They went on, and I went along the fence. Luster came away from the flower tree and we went along the fence and they stopped and we stopped and I looked through the fence while Luster was hunting in the grass.

C In conversation analysis, what is the difference between a “preferred” response and a “dispreferred” response? How would you characterize the responses by She in these two examples?

(i) HE: How about going for some coffee?

SHE: Oh … eh … I'd love to … but you see … I … I'm supposed to get this thing finished … you know

(ii) HE: I think she's really sexy.

SHE: Well … er … I'm not sure … you may be right … but you see … other people probably don’t go for all that … you know … all that make-up … so em sorry but I don't think so

D The following extract is from a conversation between two women chatting about people they both knew in high school (Overstreet, 1999: 112–113). In this extract, Crystal uses the phrase or something twice. Is she adhering to the Co-operative Principle and the Quality maxim or not? How did you decide?

JULIE: I can't remember any ge- guys in our grade that were gay.
CRYSTAL: Larry Brown an’ John Murphy. I – huh I dunno, I heard John Murphy was dressed – was like a transvestite or something.

JULIE: You’re kidding.

CRYSTAL: I – I dunno. That was a – an old rumor, I don’t even know if it was true.

JULIE: That’s funny.

CRYSTAL: Or cross-dresser or something

JULIE: Larry – Larry Brown is gay?

E We analyzed a regular turn-taking pattern in terms of the two parts found in adjacency pairs, but what about three-part and four-part exchanges? Can you suggest a way of analyzing the following exchanges that would account for the conversation structure(s) involved?

(1) JOE: Did you need anything from the store?

TOM: No thanks.

JOE: Okay.

(2) TEACHER: So, who knows where Tripoli is?

STUDENT: In Libya.

TEACHER: That’s right.

(3) PASSENGER: Are there any early morning flights to Edinburgh?

AGENT: When do you want to go?

PASSENGER: Oh, any time after 6 a.m.

AGENT: Well, there’s a 6:45.

(4) SUE: Do you have any idea what time it is?

JEN: Em, it’s just after 4.

SUE: Thanks.

JEN: No problem.
F This is a version of a story described in Widdowson (2007). When most people first read this story, they find it confusing. Can you identify the source of this confusion in terms of background knowledge or assumptions?

A man and his son were crossing the street one day when a car suddenly came towards them and hit the boy, knocking him down. In less than ten minutes an ambulance came and took the boy to the nearest hospital. As the boy was being taken into the emergency room, one of the surgeons saw him and cried out, “Oh no. This is my son!”

(i) What is Critical Discourse Analysis?

(ii) How might the following text be analyzed using that approach? This text originally appeared in the British newspaper the Sun (February 2, 1989) and is cited in van Dijk (1996: 98) and Cameron (2001: 127).

Britain Invaded by Army of Illegals

Britain is being swamped by a tide of illegal immigrants so desperate for a job that they will work for a pittance in our restaurants, cafes and nightclubs.

Immigration officers are being overwhelmed with work. Last year, 2191 “illegals” were nabbed and sent back home. But there were tens of thousands more, slaving behind bars, cleaning hotel rooms and working in kitchens …

Illegals sneak in by:

- deceiving immigration officers when they are quizzed at airports
- disappearing after their entry visas run out
- forging work permits and other documents
- running away from immigration detention centres

H

(i) What is studied in “Stylistics”?

(ii) The following text (quoted in Verdonk, 2002: 7–8) appeared on the back cover of a book of short stories by the writer Margaret Atwood. Which aspects of this text would be discussed in a stylistic analysis?
This splendid volume of short fiction testifies to Margaret Atwood’s startlingly original voice, full of rare intensity and exceptional intelligence. Each of the fourteen stories shimmers with feelings, each illuminates the unexplored interior landscape of a woman’s mind. Here men and women still miscommunicate, still remain separate in different rooms, different houses, or even different worlds. With brilliant flashes of fantasy, humor, and unexpected violence, the stories reveal the complexities of human relationships and bring to life characters who touch us deeply, evoking terror and laughter, compassion and recognition – and dramatically demonstrate why Margaret Atwood is one of the most important writers in English today.
**Discussion Topics/Projects**

I In the study of discourse, a distinction is often made between “new information” (treated as new for the reader or listener) and “given information” (treated as already known by the reader or listener). Read through the following recipe for bread sauce and identify the ways in which given information is presented. (Try to think carefully about carrying out the instructions in the Method section and how many unmentioned things you are assumed to have and use.)

II According to Deborah Schiffrin, “the analysis of discourse markers is part of the more general analysis of discourse coherence” (1987: 49). Looking at the use of discourse markers (in bold) in the following extract from conversation, do you think that they help to make this discourse more coherent? If any of them were omitted, would it become less coherent? Given these examples, how would you define discourse markers? Are they the same as pragmatic markers, as described in Chapter 10 on page 147? Do you think the word *like* (used twice here) should be treated as a discourse marker?

*I believe in that. Whatever's gonna happen is gonna happen. I believe ... that ... y'know it's fate. It really is. Because eh my husband has a brother, that was killed in an automobile accident, and at the same time there was another fellow, in there, that walked away with not even a scratch on him. And I really fee- I don't feel y'can push fate, and I think a lot of people do. But I feel that you were put here for so many, years or whatever the case is, and that's how it was meant to be. Because like when we got married, we were supposed t'get married uh like about five months later. My husband got a notice t'go into...*
the service and we moved it up. And my father died the week ... after we got married. While we were on our honeymoon. And I just felt, that move was meant to be, because if not, he wouldn’t have been there. So eh y’know it just s- seems that that’s how things work.

Language and the Brain

439
I once had a patient who suffered a right hemisphere stroke and fell to the ground, unable to walk because of a paralyzed left leg. She lay on the floor for two days, not because no one came to her aid, but because she kept blithely reassuring her husband
that she was fine, that there was nothing wrong with her leg. Only on the third day did he bring her in for treatment. When I asked her why she could not move her left leg, and held it up for her to see, she said indifferently that it was someone else’s leg.

Flaherty (2004)

In the preceding chapters we have reviewed in some detail the various features of language that people use to produce and understand linguistic messages. Where is this ability to use language located? The obvious answer is “in the brain.” However, it can’t be just anywhere in the brain. For example, it can’t be where damage was done to the right hemisphere of the patient’s brain in Alice Flaherty’s description. The woman could no longer recognize her own leg, but she could still talk about it. The ability to talk was unimpaired and hence clearly located somewhere else in her brain.
Neurolinguistics

The study of the relationship between language and the brain is called neurolinguistics. Although this is a relatively recent term, the field of study dates back to the nineteenth century. Establishing the location of language in the brain was an early challenge, but one event incidentally provided a clue.

In September 1848, near Cavendish, Vermont, a construction foreman called Phineas P. Gage was in charge of a construction crew blasting away rocks to lay a new stretch of railway line. As Mr. Gage pushed an iron tamping rod into the blasting hole in a rock, some gunpowder accidentally exploded and sent the three-and-a-half-foot long tamping rod up through his upper left cheek and out from the top of his forehead. The rod landed about fifty yards away. Mr. Gage suffered the type of injury from which, it was assumed, no one could recover. However, a month later, he was up and about, with no apparent damage to his senses or his speech.

The medical evidence was clear. A huge metal rod had gone through the front part of Mr. Gage’s brain, but his language abilities were unaffected. He was a medical marvel. The point of this rather amazing tale is that, while language may be located in the brain, it clearly is not situated right at the front.
**Language Areas in the Brain**

Since that time, a number of discoveries have been made about the specific parts in the brain that are related to language functions. We now know that the most important parts are in areas around the left ear. In order to describe them in greater detail, we need to look more closely at some of the gray matter. So, take a head, remove hair, scalp, skull, then disconnect the brain stem (connecting the brain to the spinal cord) and cut the corpus callosum (connecting the two hemispheres). If we disregard a certain amount of other material, we will basically be left with two parts, the left hemisphere and the right hemisphere. If we put the right hemisphere aside for now, and place the left hemisphere down so that we have a side view, we’ll be looking at something close to the illustration in [Figure 12.1](adapted from Geschwind, 1991).
The shaded areas in Figure 12.1 indicate the general locations of those language functions involved in speaking and listening. We have come to know that these areas exist largely through the examination, in autopsies, of the brains of people who, in life, were known to have specific language disabilities. That is, we have tried to determine where language abilities for normal users must be by finding areas with specific damage in the brains of people who had identifiable language disabilities. More brain images are presented in Task G, on page 186.
Broca’s Area

The part shown as (1) in Figure 12.1 is technically described as the “anterior speech cortex” or, more usually, as Broca’s area. Paul Broca, a French surgeon, reported in the 1860s that damage to this specific part of the brain was related to extreme difficulty in producing spoken language. It was noted that damage to the corresponding area on the right hemisphere had no such effect. This finding was first used to argue that language ability must be located in the left hemisphere and since then has been treated as an indication that Broca’s area is crucially involved in the generation of spoken language.
Wernicke’s Area

The part shown as (2) in Figure 12.1 is the “posterior speech cortex,” or Wernicke’s area. Carl Wernicke was a German doctor who, in the 1870s, reported that damage to this part of the brain was found among patients who had speech comprehension difficulties. This finding confirmed the left hemisphere location of language ability and led to the view that Wernicke’s area is part of the brain crucially involved in the understanding of spoken language.
The part shown as (3) in Figure 12.1 is the **motor cortex**, an area that generally controls movement of the muscles (for moving hands, feet, arms, etc.). The part of the motor cortex that is close to Broca’s area controls the articulatory muscles of the face, jaw, tongue and larynx and hence the physical articulation of speech. In the 1950s, two neurosurgeons, Penfield and Roberts (1959) found that, by applying small amounts of electrical current to specific parts of the brain, they could identify areas where the electrical stimulation would interfere with speech production.

The part shown as (4) in Figure 12.1 is a bundle of nerve fibers called the **arcuate fasciculus**. This was also one of Wernicke’s discoveries and is now known to form a crucial connection between Wernicke’s and Broca’s areas.
Having identified these four components, it is tempting to conclude that specific aspects of language ability can be accorded specific locations in the brain. This is called the localization view and it has been used to suggest that the brain activity involved in hearing a word, understanding it, then saying it, would follow a definite pattern. The word is heard and comprehended via Wernicke’s area. This signal is then transferred via the arcuate fasciculus to Broca’s area where preparations are made to generate a spoken version of the word. A signal is then sent to part of the motor cortex to physically articulate the word.

This is certainly an oversimplified version of what may actually take place, but it is consistent with much of what we understand about simple language processing in the brain. It is probably best to think of any proposal concerning processing pathways in the brain as some form of metaphor that may turn out to be inadequate once we learn more about how the brain functions. The “pathway” metaphor seems quite appealing in an electronic age when we are familiar with the process of sending signals through electrical circuits. In an earlier age, dominated more by mechanical technology, Sigmund Freud subtly employed a “steam engine” metaphor to account for aspects of the brain’s activity when he wrote of the effects of repression “building up pressure” to the point of “sudden release.” Even earlier, Aristotle’s metaphor was of the brain as a cold sponge that kept the blood cool.

In a sense, we are forced to use metaphors mainly because we cannot obtain direct physical evidence of linguistic processes in the brain. Because we have no direct access, we generally have to rely on what we can discover through indirect methods. Most of these methods involve attempts to work out how the system is working from clues picked up when the system has problems or malfunctions.
We have all experienced difficulty, on some occasion(s), in getting brain and speech production to work together smoothly. (Some days are worse than others, of course.) Minor production difficulties of this sort may provide possible clues to how our linguistic knowledge is organized within the brain.
The Tip of the Tongue Phenomenon

There is, for example, the *tip of the tongue* phenomenon in which we feel that some word is just eluding us. We know the word, but it just won’t come to the surface. Studies of this phenomenon have shown that speakers generally have an accurate phonological outline of the word, can get the initial sound correct and mostly know the number of syllables in the word. This experience also mainly occurs with uncommon words and names. It suggests that our “word-storage” system may be partially organized on the basis of some phonological information and that some words in the store are more easily retrieved than others.

When we make mistakes in this retrieval process, there are often strong phonological similarities between the target word we are trying to say and the mistake we produce. For example, speakers produced *secant, sextet* and *sexton* when asked to name a particular type of navigational instrument (*sextant*). Other examples are *fire distinguisher* (for “extinguisher”) and *transcendental medication* (instead of “meditation”). Mistakes of this type are sometimes referred to as *malapropisms* after a character called Mrs. Malaprop (in a play by Sheridan) who consistently produced “near-misses” for words, with great comic effect. Another comic character in a TV program who was known for his malapropisms was Archie Bunker, who once suggested that *We need a few laughs to break up the monogamy.*
Slips of the Tongue

Another type of speech error is commonly described as a *slip of the tongue*. This produces expressions such as *a long shory stort* (instead of “make a long story short”), *use the door to open the key* and *a fifty-pound dog of bag food*. Slips of this type are sometimes called *spoonerisms* after William Spooner, an Anglican clergyman at Oxford University, who was renowned for his tongue-slips. Most of the slips attributed to him involve the interchange of two initial sounds, as when he addressed a rural group as *noble tons of soil*, attempted to refer to the queen as *our queer old dean*, described God as *a shoving leopard to his flock*, or in this complaint to a student who had been absent from classes: *You have hissed all my mystery lectures.*
Slips of the Brain

Other examples are often simply word substitutions as a similar, but inappropriate word is used instead of the target. In talking about his relationship with a former president, one US president had to quickly correct himself when he said: *we've had some triumphs … made some mistakes … we’ve had some sex … eh … setbacks*. Most everyday slips, however, are not as entertaining. There are three general types. **Perseveration** is when one sound is carried over to the next word, so that *my favorite song* comes out as *my favorite fong*. **Anticipation** is when a sound is used before its occurrence in the next word, so that *roman numeral* comes out as *noman numeral*. **Exchange** is when sounds change places, so that *feel better* comes out as *beel fetter*. Although these slips are mostly treated as errors of articulation, they may actually result from slips of the brain as it tries to organize and generate linguistic messages. The different types of slips are listed in [Table 12.1](#).

Slips of the Ear

One other type of slip may provide some clues to how the brain tries to make sense of the auditory signal it receives. These have been called slips of the ear and can result, for example, in our hearing great ape and wondering why someone should be looking for one in his office. (The speaker actually said “gray tape.”) During a conversation about dogs, one five-year-old announced My uncle has a pimple, which turned out to be her misheard version of a “pit bull.” A similar type of misunderstanding seems to be behind a child’s report that in Sunday school, everyone was singing about a bear called “Gladly” who was cross-eyed. The source of this slip turned out to be a line from a religious song that went Gladly the cross I’d bear. It may also be the case that some malapropisms (e.g. transcendental medication) originate as slips of the ear. For more slips, see Task C on page 185.

Some of these humorous examples of slips may give us a clue to the normal workings of the human brain as it copes with language. However, some problems with language production and comprehension are the result of much more serious disorders in brain function.
Aphasia

If you have experienced any of those “slips” on occasion, then you will have a small hint of the types of experience that some unfortunate individuals have to live with constantly. Those people suffer from different types of language disorders, generally described as “aphasia.” Aphasia is defined as an impairment of language function due to localized brain damage that leads to difficulty in understanding and/or producing linguistic forms.

The most common cause of aphasia is a stroke (when a blood vessel in the brain is blocked or bursts), though traumatic head injuries from violence or an accident may have similar effects. Those effects can range from mild to severe reduction in the ability to use language. Someone who is aphasic often has interrelated language disorders, in that difficulties in understanding can lead to difficulties in production, for example. Consequently, the classification of different types of aphasia is usually based on the primary symptoms of someone having difficulties with language.
Broca’s Aphasia

The serious language disorder known as Broca’s aphasia (also called “motor aphasia”) is characterized by a substantially reduced amount of speech, distorted articulation and slow, often effortful speech. What is said often consists almost entirely of lexical morphemes (mostly nouns, verbs and adjectives, as described in Chapter 6). The frequent omission of functional morphemes (e.g. articles, prepositions) and inflectional morphemes (e.g. plural -s, past tense -ed) has led to the characterization of this type of aphasic speech as lacking grammatical forms, or “agrammatic.” In agrammatic speech, the grammatical markers are missing.

An example of speech produced by someone whose aphasia was not severe is the following answer to a question regarding what the speaker had for breakfast:

*I eggs and eat and drink coffee breakfast.*

However, this type of disorder can be quite severe and result in speech with lots of hesitations and really long pauses (marked by …):

*My cheek … very annoyance … main is my shoulder … achin’ all round here.*

Some patients can also have lots of difficulty in articulating single words, as in this attempt to say “steamship”: *a stail … you know what I mean … tal … stail*. In Broca’s aphasia, comprehension is typically much better than production.
Wernicke’s Aphasia

The type of language disorder that results in difficulties in auditory comprehension is sometimes called “sensory aphasia,” but is more commonly known as Wernicke’s aphasia. Someone suffering from this disorder can actually produce very fluent speech which is, however, often difficult to understand. Very general terms are used, even in response to specific requests for information, as in this sample:

*I can’t talk all of the things I do, and part of the part I can go alright, but I can’t tell from the other people.*

Difficulty in finding the correct word, sometimes referred to as anomia, also happens in Wernicke’s aphasia. To overcome their word-finding difficulties, speakers use different strategies such as trying to describe objects or talking about their purpose, as in *the thing to put cigarettes in* (for “ashtray”). In the following example (from Lesser and Milroy, 1993), the speaker tries a range of strategies when he can’t come up with the word (“kite”) for an object in a picture.

*it’s blowing, on the right, and er there’s four letters in it, and I think it begins with a C – goes – when you start it then goes right up in the air – I would I would have to keep racking my brain how I would spell that word – that flies, that that doesn’t fly, you pull it round, it goes up in the air*
Conduction Aphasia

One other, much less common, type of aphasia has been associated with damage to the arcuate fasciculus and is called conduction aphasia. Individuals suffering from this disorder sometimes mispronounce words, but typically do not have articulation problems. They are fluent, but may have disrupted rhythm because of pauses and hesitations. Comprehension of spoken words is normally good. However, the task of repeating a word or phrase (spoken by someone else) creates major difficulty, with forms such as *vayss* and *fosh* being reported as attempted repetitions of the words “base” and “wash.” What the speaker hears and understands can’t be transferred very successfully to the speech production area.

It should be emphasized that many of these symptoms (e.g. word-finding difficulty) can occur in all types of aphasia. They can also occur in more general disorders such as dementia and Alzheimer’s disease. Difficulties in speaking can also be accompanied by difficulties in writing. Impairment of auditory comprehension tends to be accompanied by reading difficulties. These language disorders are almost always the result of injury to the left hemisphere. The left hemisphere dominance for language has also been demonstrated by another research method.
Dichotic Listening

An experimental technique that has demonstrated a left hemisphere dominance for syllable and word processing is called the **dichotic listening test**. This technique uses the generally established fact that anything experienced on the right-hand side of the body is processed in the left hemisphere, and anything on the left side is processed in the right hemisphere. As illustrated in Flaherty’s (2004) description at the beginning of this chapter, a stroke in the right hemisphere resulted in paralysis of the left leg. So, a basic assumption would be that a signal coming in the right ear will go to the left hemisphere and a signal coming in the left ear will go to the right hemisphere.

With this information, an experiment is possible in which a subject sits with a set of earphones on and is given two different sound signals simultaneously, one through each earphone. For example, through one earphone comes the syllable *ga* or the word *dog*, and through the other earphone at exactly the same time comes *da* or *cat*. When asked to say what was heard, the subject more often correctly identifies the sound that came via the right ear. The process involved is best understood with the help of Figure 12.2. (You are looking at the back of this head.)
In this process, the language signal received through the left ear is first sent to the right hemisphere and then has to be sent to the left hemisphere (language center) for processing. This non-direct route takes longer than a linguistic signal received through the right ear, which goes directly to the left hemisphere. First signal to get processed wins because of what is generally known as the right-ear advantage for speech sounds.

In contrast, the right hemisphere appears to have primary responsibility for processing a lot of other incoming signals that are non-linguistic. In the dichotic listening test, it can be shown that non-verbal sounds (e.g. music, coughs, traffic noises, birds singing) are recognized more often via the left ear, meaning they are processed faster via the right hemisphere. So, among the specializations of the human brain, the right hemisphere is first choice for non-language sounds (among other things) and the left hemisphere specializes in language sounds (among other things too).

These specializations may actually have more to do with the type of processing rather than the type of material that is handled best by each of the two hemispheres. The essential distinction seems to be between analytic processing, such as recognizing the smaller details of sounds, words and phrase structures in rapid sequence, done with the “left brain,” and holistic processing, such as identifying more general structures in language and experience, done with the “right brain.”
The Critical Period

The apparent specialization of the left hemisphere for language is usually described in terms of lateral dominance or lateralization (one-sidedness). Since the human child does not emerge from the womb as a fully articulate language user, it is generally thought that the lateralization process begins in early childhood. It coincides with the period during which language acquisition takes place. During childhood, there is a period when the human brain is most ready to receive input and learn a particular language. This is sometimes called the “sensitive period” for language acquisition, but is more generally known as the critical period.

Though there is increasing evidence that it may actually start earlier in the womb, the general view is that the critical period for language acquisition lasts from birth until puberty. If a child does not acquire language during this period, for any one of a number of reasons, then he or she will find it almost impossible to learn language later on. In one unfortunate but well-documented case, we have gained some insight into what happens when the critical period passes without adequate linguistic input.
Genie

In 1970, a girl who became known as “Genie” was admitted to a children’s hospital in Los Angeles. She was thirteen years old and had spent most of her life tied to a chair in a small closed room. Her father was intolerant of any kind of noise and had beaten her whenever she made a sound as a child. There had been no radio or television, and Genie’s only other human contact was with her mother who was forbidden to spend more than a few minutes with the child to feed her. Genie had spent her whole life in a state of physical, sensory, social and emotional deprivation.

As might be expected, Genie was unable to use language when she was first brought into care. However, within a short period of time, she began to respond to the speech of others, to try to imitate sounds and to communicate. Her syntax remained very simple. The fact that she went on to develop some speaking ability and understand a fairly large number of English words provides some evidence against the notion that language cannot be acquired at all after the critical period. Yet her diminished capacity to develop grammatically complex speech does seem to support the idea that part of the left hemisphere of the brain is open to accepting a language program during childhood and, if no program is provided, as in Genie’s case, then the facility is closed down.

In Genie’s case, tests demonstrated that she had no left hemisphere language facility. So, how was she able to learn any part of language, even in a limited way? Those same tests appeared to indicate the quite remarkable fact that Genie was using the right hemisphere of her brain for language functions. In dichotic listening tests, she showed a very strong left ear advantage for verbal as well as non-verbal signals. Such a finding, supported by other studies of right brain function, raises the possibility that our capacity for language is not limited to only one or two specific areas, but is based on more complex connections extending throughout the whole brain.

When Genie was beginning to use speech, it was noted that she went through some of the same early “stages” found in normal child language acquisition. In Chapter 13, we will look at what these normal stages are.
Study Questions

2 What kind of difficulty did Wernicke identify among his patients?

3 Is the use of fire distinguisher instead of fire extinguisher a spoonerism or a malapropism?

4 What type of slip is illustrated by: I like pop porn (for popcorn)?

5 What is aphasia?

6 Damage to what part of the brain results in conduction aphasia?

7 Which type of aphasia is characterized by speech like this: speech … two times … read … wr … ripe, er, rike, er, write … ?

8 What happens in a dichotic listening test?

9 What is the critical period?

10 What did researchers discover from Genie’s dichotic listening tests?
Tasks

A We made no distinction between the left and right hemispheres in terms of shape or size, assuming they were symmetrical. However, on closer inspection, there is some asymmetry in the lateralization of the brain. What seems to be the main source of this difference between the physiology of the two hemispheres? Does this difference support the “phrenology” model of human brain organization?

B What is meant by the “bathtub effect” in descriptions of features of speech errors? Do any examples of speech errors in this chapter illustrate this effect?

C The following examples produced by young children (from Jaeger, 2005) illustrate the three kinds of slips described in Table 12.1 on page 179. The words in brackets are what we assume the child was trying to say. Can you identify which ones should be analyzed as anticipations, perseverations or exchanges?

(1) three, four, sive, six, seven (five)  
(2) the shun is sining (sun shining)  
(3) Frosted Frakes (Flakes)  
(4) Fentucky Fried chicken (Kentucky)  
(5) mashed matatoes (potatoes)  
(6) Hi, fredi pace (pretty face)  
(7) turn the wot hotter on (hot water)  
(8) Winnie the Pooh pook (book)  
(9) three little bigs and a big bad wolf (pigs)  
(10) call Bost Gusters (Ghost Busters)  
(11) not now, another nay (day)  
(12) I have a snore neck (sore)

D In this chapter we focused on the left hemisphere and how it is affected by impairments. What happens to the language of an individual after damage in the right hemisphere?

E How would you go about analyzing the following extract from Radford et al. (2009) as more likely to be indicative of agrammatism or paragrammatism? (The speaker is trying to talk about a lady’s shoe.)

Now there there I remember. I have you there what I thought was the … a lady one.  
Another. With a very short. Very very clever done. Do that the one two. Go. But there’s the liver. And there is the new. And so on.
F What happens in “brain imaging” procedures such as CAT scans, fMRI scans and PET scans that might help in the study of language and the brain?

G Using what you learned from the discussion of language areas in the brain, try to match each description (A–D) below to one of the four diagrams (1–4) in Figure 12.3, with a brief explanation of your choices. Each diagram is a simplified representation of information from a PET scan showing how blood flow in the brain is concentrated in different areas during different activities. More intense activity is shown in a darker color.

H The following extract from Buckingham and Kertesz (1976: 21) is discussed in Obler and Gjerlow (1999: 59) as an illustration of “neologic jargon aphasia.” Can you identify any characteristics of this condition that show up in the language used by this speaker? Is
the syntax badly impaired? Are morphological features such as inflections used normally or not? Does the speaker have word-finding difficulties? Would you say that this aphasia is more likely to be associated with Broca’s area or Wernicke’s area? (The speaker is responding to the question, “Who is running the store now?”)

*I don’t know. Yes, the bick, uh, yes I would say that the mick daysis nosis or chpickters. Course, I have also missed on the carfter teck. Do you know what that is? I’ve, uh, token to ingsih. They have been toast sosily. They’d have been put to myafa and made palis and, uh, myadakal senda you. That is me alordisdus. That makes anacronous senda.*
Discussion Topics/Projects

I The story of Genie is full of remarkable episodes. The following extract is from Rymer (1993), quoting Susan Curtiss, a linguist who worked with Genie for many years. How would you explain events like this?

“The story of Genie is full of remarkable episodes. The following extract is from Rymer (1993), quoting Susan Curtiss, a linguist who worked with Genie for many years. How would you explain events like this?

“Genie was the most powerful nonverbal communicator I’ve ever come across,” Curtiss told me. “The most extreme example of this that comes to mind: Because of her obsession, she would notice and covet anything plastic that anyone had. One day we were walking – I think we were in Hollywood. I would act like an idiot, sing operatically, to get her to release some of that tension she always had. We reached the corner of this very busy intersection, and the light turned red, and we stopped. Suddenly, I heard the sound – it’s a sound you can’t mistake – of a purse being spilled. A woman in a car that had stopped at the intersection was emptying her purse, and she got out of the car and ran over and gave it to Genie and then ran back to the car. A plastic purse. Genie hadn’t said a word.”

(For background reading, see chapter 17 of Rymer, 1993.)

II One aphasia patient was asked to read aloud the written words on the left below and, in each case, actually said the words on the right. Is there any pattern to be found in these errors? Does this type of phenomenon provide any clues to the way words may be stored and accessed in the brain?

Braine (1971)

First language acquisition is remarkable for the speed with which it takes place. Long before a child starts school, he or she has become an extremely sophisticated language-user, operating a system for self-expression and communication that no other creature, or computer, comes close to matching. In addition to the speed of acquisition, the fact that it generally occurs, without overt instruction, for all children, regardless of great differences in their circumstances, provides strong support for the idea that there is an innate predisposition in the human infant to acquire language. We can think of this as a special capacity for language with which each newborn child is endowed. By itself, however, this inborn language capacity is not enough.
Acquisition

The process of language acquisition has some basic requirements. During the first two or three years of development, a child requires interaction with other language-users in order to bring the general language capacity into contact with a particular language such as English. We have already seen, in the case of Genie (Chapter 12), that a child who does not hear or is not allowed to use language will learn no language. We have also identified the importance of cultural transmission (Chapter 2), meaning that the particular language a child learns is not genetically inherited, but is acquired in a particular language-using environment.

The child must also be physically capable of sending and receiving sound signals in a language. All infants make “cooing” and “babbling” noises during their first year, but congenitally deaf infants stop after about six months. So, in order to speak a language, a child must be able to hear that language being used. By itself, however, hearing language sounds is not enough. One case, reported by Moskowitz (1991), demonstrated that, with deaf parents who gave their normal-hearing son ample exposure to TV and radio programs, the boy did not acquire an ability to speak or understand English. What he did learn very effectively, by the age of three, was the use of American Sign Language, that is, the language he used to interact with his parents. A crucial requirement appears to be interaction with others via language.
Input

Under normal circumstances, human infants are certainly helped in their language acquisition by the typical behavior of older children and adults in the home environment who provide language samples, or input, for the child. Adults such as mom, dad and the grandparents tend not to address the little creature before them as if they are involved in normal adult-to-adult conversation. There is not much of this: *Well, John Junior, shall we invest in blue chip industrials, or would grain futures offer better short-term prospects?* However, there does seem to be a lot of this: *Oh, goody, now Daddy push choo choo?*

The characteristically simplified speech style adopted by someone who spends a lot of time interacting with a young child incorporates a lot of forms associated with “baby talk.” These are either simplified words (*tummy, nana*) or alternative forms, with repeated simple sounds and syllables, for things in the child’s environment (*choo-choo, poo-poo, pee-pee, wa-wa*). This type of speech style is also characterized by the frequent use of questions, often using exaggerated intonation, extra loudness and a slower tempo with longer pauses. Sometimes described as “motherese” or “child-directed speech,” this style is more generally known as “caregiver speech.”
Caregiver Speech

Built into a lot of caregiver speech is a type of conversational structure that seems to assign an interactive role to the young child even before he or she becomes a speaking participant. If we look at an extract from the speech of a mother to her child (aged 1 year 11 months) as if it were a two-party conversation, then this type of structuring becomes apparent. Notice how the mother reacts to the child’s actions and vocalizations as if they were turns in this conversation (from Bruner, 1983).

**Mother:** Look!

**Child:** (touches pictures)

**Mother:** What are those?

**Child:** (vocalizes a babble string and smiles)

**Mother:** Yes, there are rabbits.

**Child:** (vocalizes, smiles, looks up at mother)

**Mother:** (laughs) Yes, rabbit.

**Child:** (vocalizes, smiles)

**Mother:** Yes. (laughs)

Caregiver speech is also characterized by simple sentence structures and a lot of repetition and paraphrasing, with reference largely restricted to the here and now. If the child is indeed in the process of working out a system of putting sounds and words together, then these simplified models produced by the interacting adult may serve as good clues to the basic structural organization involved.
The Acquisition Schedule

All normal children develop language at roughly the same time, along much the same schedule. Since we can say the same thing for sitting up, crawling, standing, walking, using the hands and many other physical activities, it would seem that the language acquisition schedule has the same basis as the biologically determined development of motor skills and the maturation of the infant’s brain.

We could think of the child as having the biological capacity to identify aspects of linguistic input at different stages during the early years of life. Long before children begin to talk, they have been actively processing what they hear. We can identify what very young children are paying attention to by the way they increase or decrease “sucking behavior” in response to speech sounds or turn their heads in the direction of those sounds. At one month an infant is capable of distinguishing between [ba] and [pa]. During the first three months, the child produces big smiles in response to a speaking face, and starts to create distinct vocalizations.
Cooing

The earliest use of speech-like sounds has been described as cooing. During the first few months of life, the child gradually becomes capable of producing sequences of vowel-like sounds, particularly high vowels similar to [i] and [u]. By four months of age, the developing ability to bring the back of the tongue into regular contact with the back of the palate allows the infant to create sounds similar to the velar consonants [k] and [g], hence the common description as “cooing” or “gooing” for this type of production. Speech perception studies have shown that by the time they are five months old, babies can already hear the difference between the vowels [i] and [a] and discriminate between syllables like [ba] and [ga].
Babbling

Between six and eight months, the child is sitting up and producing a number of different vowels and consonants, as well as combinations such as *ba-ba-ba* and *ga-ga-ga*. This type of sound production is described as **babbling**. In the later babbling stage, around nine to ten months, there are recognizable intonation patterns to the consonant and vowel combinations being produced, as well as variation in the combinations such as *ba-ba-da-da*. Nasal sounds also become more common and certain syllable sequences such as *ma-ma-ma* and *da-da-da* are inevitably interpreted by parents as versions of “mama” and “dada” and repeated back to the child.

As children begin to pull themselves into a standing position during the tenth and eleventh months, they become capable of using their vocalizations to express emotions and emphasis. This late babbling stage is characterized by more complex syllable combinations (*ma-da-ga-ba*), a lot of sound-play and attempted imitations. This “pre-language” use of sound provides the child with some experience of the social role of speech because adults tend to react to the babbling, however incoherent, as if it is actually the child’s contribution to social interaction.

One note of caution should be sounded at this point. Child language researchers certainly report very carefully on the age of any child whose language they study. However, they are also very careful to point out that there is substantial variation among children in terms of the age at which particular features of linguistic development occur. It is worth remembering that even a great thinker like Albert Einstein was reported to have been very slow in developing spoken language skills. So, we should always treat statements concerning development stages such as “by six months” or “by the age of two” as general approximations and subject to variation in individual children.
The One-Word Stage

Between twelve and eighteen months, children begin to produce a variety of recognizable single-unit utterances. This period, traditionally called the one-word stage, is characterized by speech in which single terms are used for objects such as “milk,” “cookie,” “cat,” “cup” and “spoon” (usually pronounced [pun]). Other forms such as [Asæ] may occur in circumstances that suggest the child is producing a version of What’s that, so a term such as “single-unit” is more accurate. We use the term holophrastic speech (meaning a single form functioning as a phrase or sentence) to describe an utterance that could be a word, a phrase, or a sentence.

While many of these holophrastic utterances seem to be used to name objects, they may also be produced in circumstances that suggest the child is already extending their use. An empty bed may elicit the name of a sister who normally sleeps in the bed, even in the absence of the person named. During this stage, then, the child may be able to refer separately to Karen and bed, but isn’t ready yet to put the forms together in a more complex phrase. Well, it is a lot to expect from someone who can only walk with a stagger and has to come down stairs backwards.
The Two-Word Stage

Depending on what we count as an occurrence of two distinct words used together, the two-word stage can begin around eighteen to twenty months, as the child’s vocabulary moves beyond fifty words. By the time the child is two years old, a variety of combinations, similar to baby chair, mommy eat, cat bad, will usually have appeared. The adult interpretation of such combinations is, of course, very much tied to the context of their utterance. The phrase baby chair may be taken as an expression of possession (= this is baby’s chair), or as a request (= put baby in chair), or as a statement (= baby is in the chair), depending on different circumstances. Here are some other examples reported from the two-word stage:

big boat   doggie bark   hit ball   mama dress   more milk   shoe off

Whatever it is that the child actually intends to communicate through such expressions, the significant functional consequences are that the adults or, more often, older children behave as if communication is taking place. That is, the child not only produces speech, but also receives feedback confirming that the utterance worked as a contribution to the interaction. Moreover, by the age of two, whether the child is producing 200 or 300 distinct “words,” he or she will be capable of understanding five times as many.
Telegraphic Speech

Between two and two and a half years old, the child begins producing a large number of utterances that could be classified as “multiple-word” speech. The salient feature of these utterances ceases to be the number of words, but the variation in word forms that begins to appear. Before we investigate this development, we should note a stage that is described as telegraphic speech. This is characterized by strings of words (lexical morphemes) in phrases or sentences such as this shoe all wet, cat drink milk and daddy go bye-bye. The child has clearly developed some sentence-building capacity by this stage and can get the word order correct. While this type of telegram-format speech is being produced, inflections (-ing) begin to appear in some word forms and simple prepositions (in, on) are also used.

By the age of two and a half, the child’s vocabulary is expanding rapidly and the child is initiating more talk while increased physical activity includes running and jumping. By three, the vocabulary has grown to hundreds of words and pronunciation has become clearer. At this point, it is worth considering what kind of influence the adults have in the development of the child’s speech.
The Acquisition Process

As the linguistic repertoire of the child increases, it is often assumed that the child is, in some sense, being “taught” the language. This idea is not really supported by what the child actually does. For the vast majority of children, no one provides any instruction on how to speak the language. A more accurate view would have the children actively constructing, from what is said to them and around them, possible ways of using the language. The child’s linguistic production appears to be mostly a matter of trying out constructions and testing whether they work or not.

It is simply not possible that the child is acquiring the language principally through adult instruction. Certainly, children imitate what adults say and they are clearly in the process of adopting a lot of vocabulary from the speech they hear (the input). However, adults simply do not produce many of the expressions that turn up in children’s speech. Notice how, in the following extract (Clark, 1993), the child creates a new verb (to Woodstock) in the context.

**NOAH** (picking up a toy dog): *This is Woodstock.*

(He bobs the toy in Adam’s face)

**ADAM:**

*Hey Woodstock, don’t do that.*

(Noah persists)

**ADAM:**

*I’m going home so you won’t Woodstock me.*
Learning through Imitation?

Similar evidence against “imitation” as the major source of the child’s speech production comes from studies of the structures used by young children. They may repeat single words or phrases, but not the sentence structures. In the following two examples, the children were asked to repeat what the adult said (on the left).

<table>
<thead>
<tr>
<th>The dogs are hungry</th>
<th>- dog hungry</th>
</tr>
</thead>
<tbody>
<tr>
<td>The owl who eats candy runs fast</td>
<td>- owl eat a candy and he run fast.</td>
</tr>
</tbody>
</table>

It is likely that the children understand what the adults are saying in these examples. They just have their own way of expressing what they understand.
Learning through Correction?

It is also unlikely that adult “corrections” are a very effective determiner of how the child speaks. One example of attempted correction (*other one spoon*) was quoted at the beginning of the chapter. Even when the correction is attempted in a subtle manner, the child will continue to use a personally constructed form, despite the adult’s repetition of what the correct form should be. Note that in the following dialog (from Cazden, 1972) the child, a four-year-old, is neither imitating the adult’s speech nor accepting the adult’s correction.

**CHILD:** My teacher holded the baby rabbits and we patted them.

**MOTHER:** Did you say your teacher held the baby rabbits?

**CHILD:** Yes

**MOTHER:** What did you say she did?

**CHILD:** She holded the baby rabbits and we patted them.

**MOTHER:** Did you say she held them tightly?

**CHILD:** No, she holded them loosely.

One factor that seems to be important in the child’s acquisition process is the use of sound and word combinations, either in interaction with others or in word play, alone. One two-year-old, described in Weir (1966), was tape-recorded as he lay in bed alone and could be heard playing with words and phrases, *I go dis way ... way bay ... baby do dis bib ... all bib ... bib ... dere*. Word play seems to be an important element in the development of the child’s linguistic repertoire. When we look more closely at development beyond the telegraphic stage, we can trace specific linguistic features that turn up in the steady stream of speech from the little chatterbox.
Developing Morphology

By the time a child is two and a half years old, he or she is going beyond telegraphic speech forms and incorporating inflectional and functional morphemes. The first to appear is the -ing form in expressions such as cat sitting and mommy reading book. This is usually followed by the prepositions in and on, in either order.

The next morphological development is typically the marking of regular plurals with the -s form, as in boys and cats. The acquisition of the plural marker is often accompanied by a process of overgeneralization. The child overgeneralizes the apparent rule of adding -s to form plurals and will talk about foots and mans. When the alternative pronunciation of the plural morpheme used in houses (i.e. ending in [-ɔz]) comes into use, it too may be overgeneralized, resulting in boyses or footses.

Irregular plurals such as men and feet appear next (sometimes overgeneralized, as in some mens or two feets), along with irregular past tense forms such as came and went. Not long after we see different forms of the verb “to be,” such as is and are. At about the same time as these new verb forms appear, and sometimes before them, the possessive inflection -’s becomes part of noun phrases such as Karen’s bed and mommy’s book. Also in noun phrases, the articles a and the start to be used.

Finally, the regular past tense forms with -ed, as in it opened or he walked, become common, with some overgeneralization in examples such as he goed and you comed here, and also forms like walkeded and wented. The final inflectional morpheme to be used, present tense -s, occurs first on verbs (comes, knows), then with auxiliary verbs (does, has). There may be some variability in individual cases, but the general acquisition sequence is presented in Table 13.1 (based on Brown, 1973).

Developing Syntax

There have been numerous studies of the development of syntax in children’s speech. We will look at the development of two structures that seem to be acquired in a regular way by most English-speaking children. In the formation of questions and the use of negatives, there appear to be three identifiable stages. The ages at which children go through these stages can vary quite a bit, but the general pattern seems to be that Stage 1 occurs between 18 and 26 months, Stage 2 between 22 and 30 months, and Stage 3 between 24 and 40 months. (The overlap in the periods is a reflection of the different rates at which different children normally develop.)
Forming Questions

In forming questions, the child’s first stage has two procedures. Simply add a \textit{wh}-form (\textit{Where}) to the beginning of the expression (\textit{Where kitty?}) or utter the expression with a rise in intonation toward the end (\textit{Sit chair?}).

In the second stage, more complex expressions can be formed, but the rising intonation strategy continues to be used (\textit{You want eat?}). It is noticeable that more \textit{wh}-forms, such as \textit{What} and \textit{Why} come into use (\textit{Why you smiling?}).

In the third stage, the change in position of the auxiliary verb in English questions, called inversion, becomes evident in the child’s speech (\textit{I can have … ⇒ Can I have … ?}), but doesn’t automatically spread to all \textit{wh}-question types. In fact, some children beginning school may still prefer to form \textit{wh}-questions (especially with negatives) without the type of structure found in adult speech. They tend to say \textit{Why kitty can’t do it?} instead of \textit{Why can’t kitty do it?}. Apart from these problems with \textit{wh}-questions and continuing trouble with the morphology of verbs (e.g. \textit{Did I caught it?} instead of \textit{Did I catch it?}), Stage 3 questions are generally quite close to the adult model.

These observations are summarized in Table 13.2.

Forming Negatives

In the case of negatives, Stage 1 seems to involve a simple strategy of putting *No* or *Not* at the beginning. In some cases (e.g. *No doing it*), the negative may be used for a denial (= *I am not doing it*), while in other circumstances, it may be used to express a desire (= *I don’t want to do it*), but the utterance doesn’t change. At this stage, both *no* and *not* can be attached to nouns (*no mitten*) and verbs (*not sit there*).

In the second stage, the additional negative forms *don’t* and *can’t* appear, and, with *no* and *not*, are increasingly used in front of the verb rather than at the beginning of the utterance. At this stage, children seem to be using the form *don’t* as a single unit, with no connection to the alternative *do not*, probably because the contracted form of *not* (*n’t*) is simply not heard as a distinct element in speech.

The third stage sees the incorporation of other auxiliary forms such as *didn’t* and *won’t* while the typical Stage 1 forms disappear. A very late acquisition is the negative form *isn’t*, with the result that some Stage 2 forms (with *not* instead of *isn’t*) continue to be used for quite a long time, as exemplified in *This not ice cream*. These observations are summarized in Table 13.3 below.

The study of children’s use of negative forms has revealed some entertaining cases where the children involved clearly had their own rules for negative sentences. One famous example (from McNeill, 1966) also shows the futility of overt adult “correction” of children’s speech.
CHILD: Nobody don’t like me.

MOTHER: No, say “nobody likes me.”

CHILD: Nobody don’t like me.

(Eight repetitions of this dialog)

MOTHER: No, now listen carefully; say “nobody likes me.”

CHILD: Oh! Nobody don’t likes me.
 Developments Semantics

The anecdotes that parents retell about their child’s early speech (to the intense embarrassment of the grown-up child) usually involve examples of the strange use of words. Having been warned that flies bring germs into the house, one child was asked what “germs” were and the answer was “something the flies play with.” It is not always possible to determine so precisely the meanings that children attach to the words they use.

It seems that during the holophrastic stage many children use their limited vocabulary to refer to a large number of unrelated objects. One child first used bow-wow to refer to a dog and then to a fur piece with glass eyes, a set of cufflinks and even a bath thermometer. The word bow-wow seemed to have a meaning like “object with shiny bits.” Other children often extend bow-wow to refer to cats, cows and horses.

This process is called overextension. The most common pattern is for the child to overextend the meaning of a word on the basis of similarities of shape, sound and size, and, to a lesser extent, movement and texture. Thus the word ball is extended to all kinds of round objects, including a lampshade, a doorknob and the moon. Or, a tick-tock is initially used for a watch, but can also be used for a bathroom scale with a round dial. On the basis of size, presumably, the word fly was first used for the insect and then came to be used for specks of dirt and even crumbs of bread. Apparently due to similarities of texture, the expression sizo was first used by one child for scissors, and then extended to all metal objects. The semantic development in a child’s use of words is usually a process of overextension initially, followed by a gradual process of narrowing down the application of each term as more words are learned.

Although overextension has been well documented in children’s speech production, it isn’t necessarily used in speech comprehension. One two-year-old used apple, in speaking, to refer to a number of other round objects like a tomato and a ball, but had no difficulty picking out the apple, when asked, from a set of round objects including a ball and a tomato.

One interesting feature of the young child’s semantics is the way certain lexical relations are treated. In terms of hyponymy, the child will almost always use the “middle” level term in a hyponymous set such as animal – dog – terrier. It would seem more logical to learn the most general term (animal), but all evidence indicates that children first use dog with an overextended meaning close to the meaning of “animal.” This may be connected to
a similar tendency in adults, when talking to young children, to refer to flowers (not the more general plants, or the more specific tulips).
Later Developments

Some types of antonymous relations are acquired fairly late (after the age of five). In one study, a large number of kindergarten children pointed to the same heavily laden apple tree when asked *Which tree has more apples?* and also when asked *Which tree has less apples?*. They just seem to think the correct response will be the larger one, disregarding the difference between *more* and *less*. The distinctions between a number of other pairs such as *before/after* and *buy/sell* also seem to be later acquisitions. The ability to produce certain types of complex structures and extended discourse are also much later developments.

Despite the fact that children are still in the process of acquiring a number of other aspects of their first language through the later years of childhood, it is normally assumed that, by the age of five, they have completed the greater part of the basic language acquisition process. They have become accomplished users of a first language. According to some, the child is then in a good position to start learning a second (or foreign) language. However, most people don’t start trying to learn another language until much later. The question that always arises is: if first language acquisition was so straightforward and largely automatic, why is learning a second language so difficult for so many people? We will try to answer that question in Chapter 14.
Study Questions

1 Can you describe four typical features of caregiver speech?

2 At what age is an infant capable of distinguishing between [ba] and [pa]?

3 Why are some of the infant’s first sounds described as “cooing”?

4 During which period do children produce holophrastic speech?

5 During which stage do children typically first produce syllable sequences similar to *mama* and *dada* and how old are they?

6 At about what age do children typically begin producing varied syllable combinations such as *ma-da-ga-ba*?

7 Which of these expressions is likely to be used before the others?
   - *mommy books* or *mommy’s book* or *mommy reading* or *mommy goed*

8 Which of these expressions is likely to be used before the others?
   - *What book name?* or *How that opened?* or *Where kitty go?*

9 Which of these two utterances was produced by the older child and why?
   - (a) *I not hurt him*
   - (b) *No the sun shining*

10 What is the term used to describe the process involved when a child uses one word like *ball* to refer to an apple, an egg, a grape and a ball?
Tasks

A The “sucking behavior” of infants was mentioned in this chapter in connection with early speech perception. How can it be measured and what can we learn from these measurements?

B It has been proposed that very young children acquiring English are able to identify the primary stress in words they hear and often use a trochaic stress pattern in their early attempts to produce those words.

(i) What is a trochaic stress pattern?

(ii) Which of the following examples of children’s versions of the English words (in brackets) might be taken as evidence that these children have a preference for trochaic structure in creating words?

C The connection between the early development of motor skills and the development of speech for an average child in an English-speaking environment was described in detail by Lenneberg (1967: 128–130) and recently elaborated by Iverson (2010). Can you complete Table 13.4 by adding appropriate descriptions of motor skills and speech skills at each age, showing how they develop together? (There are two descriptive phrases for some levels.)

Motor Skills

can walk with support

can sit, bend forward and reach for objects

can move easily on hands and feet

can lift head and hands from a lying position

505
can sit up with support

can grasp with thumb and fingers

puts objects such as toys or fingers in mouth while making sounds

can pull self into standing position

**Speech Skills**

produces more consonant-like sounds as well as vowels

produces squealing, gurgling and cooing sounds

produces sound play, bubbles and syllable combinations (e.g. [da da ba ba])

turns head to human speech sounds

produces longer vowels and babbling sounds, some like syllables (e.g. [da], [mu])

recognizes different sounds (e.g. [ba] versus [ga])

easily produces repeated syllables with different consonants (e.g. [ba da ma])

produces more vocalizations with regular rhythm of syllables (e.g. [ba ba ba])

The following examples are from the speech of three children. Identify which child is at the earliest stage, which is next in order, and which is at the most advanced stage. Describe those features in the examples from each child’s speech that support your ordering.

**CHILD X:** *You want eat?*
  *I can’t see my book.*
  *Why you waking me up?*

**CHILD Y:** *Where those dogs goed?*
  *You didn’t eat supper.*
  *Does lions walk?*

**CHILD Z:** *No picture in there.*
  *Where momma boot?*
  *Have some?*

There are two distinct theoretical perspectives on how first language acquisition takes place, generally labeled the “rational” perspective and the “empirical” perspective. We can characterize each perspective with a number of tenets or principles, as illustrated in the following statements. Divide these statements into two sets, one representing the rational perspective and the other representing the empirical perspective. Which perspective do you prefer?

1. Acquisition proceeds in a piecemeal fashion, building on what is already there.
2. Acquisition takes places along a predetermined path.
3. Children begin life with some knowledge of the possible units of language.
4. Children learn to say things unrelated to input.
5. General learning mechanisms account for language learning.
6. It takes time to integrate new linguistic information with existing knowledge.
7. Language learning is independent of other kinds of learning.
8. New linguistic knowledge is acquired very quickly.
9. Speech is perceived from the start as distinct from any other physical stimuli.
10. There are only a few fixed possibilities of language structures to learn.
11. There are many possible language structures to be learned.
(12) There is no initial distinction between speech and any other physical stimuli.

Discussion Topics/Projects

I In our discussion of developing semantics, we focused mainly on the use of nouns. In the following examples, a young child (age shown as year; month) seems to be using verbs in a way that is not based on typical adult uses and hence unlikely to be “imitations.” Is there any consistent pattern in these examples? Can you suggest an explanation for this child’s choice of words for the kinds of actions being described?

(2; 3) I come it closer so it won’t fall (= bring it closer)
(2; 6) Mommy, can you stay this open? (= keep this open)
(2; 8) Daddy, go me round (= make me go round)
(2; 9) I’m gonna fall this on her (= drop this on her)
(2;11) How would you flat it? (= flatten it)
(3; 1) I’m singing him (= making him sing)

(For background reading, see chapter 6 of Clark, 2009)

II Which of these three metaphors of first language acquisition (from Valian, 1999) would you agree with and why?

(a) According to the copy metaphor, “the child gradually aligns her speech with that of her language community” and “the focus is on an active role for input.”

(b) According to the hypothesis testing metaphor, “the child forms and tests hypotheses about what structures exist in the language” and “the child is not copying the input.”

(c) According to the trigger metaphor, “the child neither copies the input nor evaluates it” and “a given piece of input triggers the correct parametric value,” assuming the child has innate knowledge of a small set of possible parametric values.

“Easter is a party for to eat of the lamb,” the Italian nanny explained. “One too may eat of the chocolate.”

“And who brings the chocolate?” the teacher asked.

I knew the word, so I raised my hand, saying, “The rabbit of Easter. He bring of the chocolate.”

“A rabbit?” The teacher, assuming I’d used the wrong word, positioned her index fingers on top of her head, wriggling them as though they were ears. “You mean one of these? A rabbit rabbit?”
“Well, sure,” I said. “He come in the night when one sleep on a bed. With a hand he have a basket and foods.”

The teacher sighed and shook her head. As far as she was concerned, I had just explained everything that was wrong with my country. “No, no,” she said. “Here in France the chocolate is brought by a big bell that flies in from Rome.”

I called for a time-out. “But how do the bell know where you live?”

“Well,” she said, “how does a rabbit?”

Sedaris (2000)

Some children grow up in a social environment where more than one language is used and are able to acquire a second language in circumstances similar to those of first language acquisition. Those fortunate individuals are bilingual (see Chapter 18). However, most of us are not exposed to a second language until much later and, like David Sedaris, our ability to use a second language, even after years of study, rarely matches ability in our first language.
Second Language Learning

There is something of an enigma in this situation, since there is apparently no other system of “knowledge” that we can learn better at two or three years of age than at thirteen or thirty. A number of reasons have been suggested to account for this enigma, and a number of different approaches have been proposed to help learners become as effective communicating in a foreign or second language (L2) as they are in their first language (L1).

A distinction is sometimes made between learning in a “foreign language” setting (learning a language that is not generally spoken in the surrounding community) and a “second language” setting (learning a language that is spoken in the surrounding community). That is, Japanese students in an English class in Japan are learning English as a foreign language (EFL) and, if those same students were in an English class in the USA, they would be learning English as a second language (ESL). In either case, they are simply trying to learn another language, so the expression second language learning is used more generally to describe both situations.
Acquisition and Learning

A more significant distinction is made between acquisition and learning. The term acquisition describes the gradual development over time of ability in a language by using it naturally in communicative situations with others who know the language. Acquisition normally takes place without a teacher and without much attention to the details of what is being acquired. The term learning, however, applies to a more conscious process of accumulating knowledge through analysis of features of a language, such as vocabulary and grammar, typically in an institutional setting, with teachers. (Mathematics, for example, is learned, not acquired.)

Activities associated with learning have traditionally been used in second language teaching in schools and have a tendency, when successful, to result in more knowledge “about” the language (as demonstrated in tests) than fluency in actually using the language (as demonstrated in social interaction). Activities associated with acquisition are those experienced by the young child and, by analogy, those who “pick up” a second language from long periods spent in interaction, constantly using the language, with native speakers of the language. (Native speakers are those who speak the language as their L1.) This distinction is also sometimes equated with preferred learning styles; some individuals prefer an analytic approach while others prefer a holistic approach. However, individuals whose L2 exposure is primarily a learning type of experience tend not to develop the same kind of general proficiency as those who have had more of an extended acquisition type of experience.
Acquisition Barriers

For most people, the experience with an L2 is fundamentally different from their L1 experience and it is hardly conducive to acquisition. They usually encounter the L2 during their teenage or adult years, in a few hours each week of school time (rather than via the constant interaction experienced as a child), with a lot of other things going on (young children have little else to do). They also have developed an unconscious commitment to the sounds and structures of an already known language that has been in use for most of their daily communicative requirements for many years. Despite the fact that insufficient time, focus and incentive undermine many L2 learning attempts, there are some individuals who seem to be able to overcome the difficulties and develop an ability to use the L2 quite effectively, though not usually sounding like a native speaker.

However, even in ideal acquisition situations, very few adults seem to reach native-like proficiency in using an L2. There are individuals who can achieve great expertise in the written language, but not the spoken language. One example is Joseph Conrad (1857–1924), who wrote novels in English that became classics of English literature, but whose English speech retained the strong Polish accent of his L1. This might suggest that some features of an L2, such as vocabulary and grammar, are easier to learn than others, such as pronunciation. Indeed, without early experience using the sounds and intonation of the L2, even highly proficient adult learners are likely to be perceived as having an “accent” of some kind.
The Age Factor

This type of observation is sometimes taken as evidence that, after the critical period for language acquisition has passed, around the time of puberty, it becomes very difficult to acquire another language fully (see Chapter 12). We might think of this process in terms of our inherent capacity for language being taken over by features of the L1, with a resulting loss of openness to receive the features of another language. Given the example of Joseph Conrad and many others, we might note that the dominance of the L1 is particularly strong in terms of pronunciation.

Against this view, it has been demonstrated that students in their early teens are quicker and more effective L2 learners in the classroom than, for example, seven-year-olds. It may be, of course, that the effective learning of an L2 (even with a trace of an accent) requires a combination of factors. The optimum age for learning may be during the years from about ten to sixteen when the flexibility of our inherent capacity for language has not been completely lost, and the maturation of cognitive skills allows a more effective analysis of the regular features of the L2 being learned.
Affective Factors

Yet even during this proposed optimum age for L2 learning, there may exist an acquisition barrier of quite a different kind. Teenagers are typically much more self-conscious than younger children. If there is a strong element of unwillingness or embarrassment in attempting to produce the different sounds of another language, then it may override whatever physical and cognitive abilities there are. If this self-consciousness is accompanied by a lack of empathy with the other culture (for example, feeling no identification with its speakers or their customs), then the subtle effects of not really wanting to sound like a Russian or a German or an American may strongly inhibit the learning process.

This type of emotional reaction, or “affect,” may also be the result of dull textbooks, unpleasant classroom surroundings or an exhausting schedule of study and/or work. All these negative feelings or experiences are affective factors that can create a barrier to acquisition. Basically, if we are stressed, uncomfortable, self-conscious or unmotivated, we are unlikely to learn very much. In contrast, learners who have other personality traits, such as self-confidence, low anxiety and a positive self-image, seem better able to overcome difficulties in the learning space.

Children are generally less constrained by affective factors. Descriptions of L2 acquisition in childhood are full of instances where young children quickly overcome their inhibitions as they try to use new words and phrases. Adults can sometimes overcome their inhibitions too. In one intriguing study, a group of adult L2 learners volunteered to have their self-consciousness levels reduced by having their alcohol levels gradually increased. Up to a certain point, the pronunciation of the L2 noticeably improved, but after a certain number of drinks, as we might expect, pronunciations deteriorated rapidly. Courses introducing “French with cognac” or “Russian with vodka” may provide a partial solution, but the inhibitions are likely to return with sobriety.
Focus on Teaching Method

Despite all these barriers, the need for instruction in other languages has led to a variety of educational approaches and methods aimed at fostering L2 learning. As long ago as 1483, William Caxton used his newly established printing press to produce a book of *Right good lernynge for to lerne shortly frensch and englyssh*. He was not the first to compile exercise material for L2 learners and his phrase-book format with customary greetings (*Syre, god you kepe. I haue not seen you in longe tyme*) has many modern counterparts. More recent approaches to L2 learning have tended to reflect different theoretical views on how an L2 might best be learned.
The Grammar–Translation Method

The most traditional approach is to treat L2 learning in the same way as any other academic subject. Vocabulary lists and sets of grammar rules are used to define the target of learning, memorization is encouraged, and written language rather than spoken language is emphasized. This method has its roots in the traditional teaching of Latin and is described as the grammar–translation method. This emphasis on learning about the L2 often leaves students quite ignorant of how the language might be used in everyday conversation. The method clearly produced many successful L2 users over the centuries, but students often leave school, having achieved high grades in French class via this method, yet find themselves at a loss when confronted by the way the French in France actually use their language.
The Audiolingual Method

A very different approach, emphasizing the spoken language, became popular in the middle of the twentieth century. It involved a systematic presentation of the structures of the L2, moving from the simple to the more complex, in the form of drills that the student had to repeat. This approach, called the audiolingual method, was strongly influenced by a belief that the fluent use of a language was essentially a set of “habits” that could be developed with a lot of practice. This practice involved hours spent in a language lab repeating oral drills. Versions of this approach are still used in language teaching, but critics have noted that isolated practice in drilling language patterns bears no resemblance to the interactional nature of actual spoken language use. Moreover, it can be incredibly boring.
Communicative Approaches

More recent revisions of the L2 learning experience can best be described as communicative approaches. They are partially a reaction against the artificiality of “pattern-practice” and also against the belief that consciously learning the grammar rules of a language will result in an ability to use the language. Although there are different versions of this approach, they are all based on a belief that the functions of language (what it is used for) should be emphasized rather than the forms of the language (correct forms and structures). Classroom lessons are likely to be organized around concepts such as “asking for things” in different social settings, rather than “the forms of the past tense” in different sentences. These changes have coincided with attempts to provide more appropriate materials for L2 learning that has a specific purpose, as in “English for medicine” or “Japanese for business.”
**Focus on the Learner**

The most fundamental change in the area of L2 studies in recent years has been a shift from concern with the teacher, the textbook and the method to an interest in the learner and the acquisition process. For example, one radical feature of most communicative approaches is the toleration of “errors” produced by students. Traditionally, “errors” were regarded negatively and they had to be avoided or eradicated. The more recent acceptance of such errors in learners’ use of the L2 is based on a fundamental shift in perspective from the more traditional view of how L2 learning takes place.

Rather than consider a Spanish (L1) speaker’s production of *in the room there are three womens* as simply a failure to learn correct English (which can be remedied through extra practice of the correct form), we can look at this utterance as an indication of the natural L2 acquisition process in action. An “error,” then, is not something that hinders a student’s progress, but is probably a clue to the active learning progress being made by the student as he or she tries out ways of communicating in the new language. Just as children acquiring their L1 produce certain types of ungrammatical forms at times, so we might expect the L2 learner to produce similar forms at certain stages (see Chapter 13). The example of *womens* might be seen as a type of overgeneralization (of *-s* as the plural marker), used by the learner based on the most common way of making plural forms in English.
Transfer

Of course, some errors may be due to “transfer” (also called “crosslinguistic influence”). Transfer means using sounds, expressions or structures from the L1 when performing in the L2. For example, a Spanish (L1) speaker who produces *take it from the side inferior* may be trying to use the Spanish adjective *inferior* (= lower in English) and placing it after the noun, as is typical in Spanish constructions. If the L1 and L2 have similar features (e.g. marking plural on the ends of nouns), then the learner may be able to benefit from the **positive transfer** of L1 knowledge to the L2. On the other hand, transferring an L1 feature that is really different from the L2 (e.g. putting the adjective after the noun) results in **negative transfer** and it may make the L2 expression difficult to understand. The impact of negative transfer on communicative success tends to be greater when the L1 and L2 are really different types of languages, making the task of becoming proficient in English more demanding for Chinese than for German speakers. We should remember that negative transfer (also called “interference”) is more common in the early stages of L2 learning and decreases as the learner develops greater familiarity with the L2.
Interlanguage

On close inspection, the language produced by L2 learners contains a large number of “errors” that seem to have no connection to the forms of either the L1 or L2. For example, the Spanish L1 speaker who says in English *She name is Maria* is producing a form that is not used by adult speakers of English, does not occur in English L1 acquisition by children, and is not based on a structure in Spanish. Evidence of this sort suggests that there is an in-between system used in the L2 acquisition process that certainly contains aspects of the L1 and L2, but which is an inherently variable system with rules of its own. This system is called an interlanguage and it is now considered to be the basis of all L2 production. (Task G on page 219 has examples.)

If some learners develop a fairly fixed repertoire of L2 expressions, containing many forms that do not match the target language, and seem not to be progressing any further, their interlanguage is said to have “fossilized.” The process of fossilization in L2 pronunciation seems to be the most likely basis of what is perceived as a foreign accent. However, an interlanguage is not designed to fossilize. It will naturally develop and become a more effective means of L2 communication given appropriate conditions. Discovering just what count as the appropriate conditions for successful L2 learning is an ongoing area of investigation.
Motivation

There are several factors that combine in a profile of a successful L2 learner. Obviously, the motivation to learn is important. Many learners have an instrumental motivation. That is, they want to learn the L2 in order to achieve some other goal, such as completing a graduation requirement or being able to read scientific publications, but they have no plans to engage in much social interaction using the L2. In contrast, those learners with an integrative motivation want to learn the L2 for social purposes, to take part in the social life of a community using that language and to become an accepted member of that community.

It is also worth noting that those who experience some success in L2 communication are among the most motivated to learn. So, motivation may be as much a result of success as a cause. A language-learning situation that provides support and encourages students to try to use whatever L2 skills they have in order to communicate successfully must consequently be more helpful than one that dwells on errors, corrections and a failure to be perfectly accurate. Indeed, the learner who is willing to guess, risks making mistakes and tries to communicate in the L2 will tend, given the opportunity, to be more successful. An important part of that opportunity is the availability of “input.”
Input and Output

The term input is used, as in L1 acquisition (see Chapter 13), to describe the language that the learner is exposed to. To be beneficial for L2 learning, that input has to be comprehensible, because we can’t process what we don’t understand. Input can be made comprehensible by being simpler in structure and vocabulary, as in the variety of speech called foreigner talk. Native speakers of English may try to ask an international student How are you getting on in your studies?, but, if not understood, may switch to English class, you like it? This type of foreigner talk may be beneficial, not only for immediate communication, but also for providing the learner with comprehensible examples of the basic structure of the L2 as input.

As the learner’s interlanguage develops, however, there is a need for more interaction and some kind of “negotiated input.” Negotiated input is L2 material that the learner can acquire in interaction through requests for clarification while active attention is being focused on what is said. In the following interaction (from Pica et al., 1991), notice how the learner, a non-native speaker (NNS) of English, and the English native speaker (NS) negotiate meaning together. The comprehensible input (i.e. using the word triangle to describe a shape) is provided at a point where the learner needs it and is paying attention to the meaning in context.

NS: like part of a triangle?
NNS: what is triangle?
NS: a triangle is a shape um it has three sides
NNS: a peak?
NS: three straight sides
NNS: a peak?
NS: yes it does look like a mountain peak, yes
NNS: only line only line?
NS: okay two of them, right? one on each side? a line on each side?
NNS: yes
NS: little lines on each side?
In this type of interaction, the learner experiences the benefits of both receiving input (hearing the L2) and producing output (speaking the L2). The opportunity to produce comprehensible output in meaningful interaction seems to be another important element in the learner’s development of L2 ability, yet it is one of the most difficult things to provide in large L2 classes.
Task-Based Learning

One solution has been to create different types of tasks and activities in which learners have to interact with each other, usually in small groups or pairs, to exchange information or solve problems. The assumption in using tasks such as “describe a way to get from A to B so that your partner can draw the route on a map” or “plan a shopping trip with your partner by making a shopping list” is that students will improve their ability, especially their fluency, by using the L2 in an activity that focuses on getting meaning across and has a clear goal. Despite fears that learners will simply learn each other’s “mistakes,” the results of such task-based learning provide overwhelming evidence of more and better L2 use by more learners. The goal of such activities is not that the learners will know more about the L2, but that they will develop communicative competence in the L2.
Communicative Competence

Communicative competence can be defined as the general ability to use language accurately, appropriately and flexibly. The first component is grammatical competence, which involves the accurate use of words and structures. Concentration on grammatical competence only, however, will not provide the learner with the ability to interpret or produce L2 expressions appropriately.

The ability to use appropriate language is the second component, called sociolinguistic competence. It enables the learner to know when to say Can I have some water? versus Give me some water! in the social context. Much of what was discussed in terms of pragmatics (see Chapter 10) has to become familiar in the cultural context of the L2 if the learner is to develop sociolinguistic competence.

The third component is called strategic competence. This is the ability to organize a message effectively and to compensate, via strategies, for any difficulties. In L2 use, learners inevitably experience moments when there is a gap between communicative intent and their ability to express that intent. Some learners may just stop talking (bad idea), whereas others will try to express themselves using a communication strategy (good idea). For example, a Dutch L1 speaker wanted to refer to een hoefijzer in English, but didn’t know the English word. So, she used a communication strategy with vocabulary she already knew, saying the things that horses wear under their feet, the iron things and the listener understood immediately what she meant (horseshoes). This flexibility is a key element in communicative success and those learners who develop their strategic competence in order to overcome potential communication problems in interaction will inevitably have more success as L2 speakers. See Task E on page 218 for more strategies.

E Classroom activities in communicative language teaching create situations in which L2 learners produce different types of communication strategies. Can you match each type of strategy (1)–(6) with one of the examples (a)–(f)? How would you rank them from least to most effective?

(1) appeal for assistance   (4) message abandonment
(2) approximation           (5) mime or gesture
(a) *the color is dark and ... the size is just as a hand ... it is made of ... la- leather*
   (talking about a glove)

(b) *how do you say in English that word ... we say in Spanish “bujía”*
   (talking about a candlestick)

(c) *the man he play a ... you know ... it makes a [whistles] like that*
   (talking about a small musical pipe)

(d) *the first you ... like put together and you ... do the next step ... I can't ... I'm sorry*
   (talking about a plunge coffee maker)

(e) *maybe is something like a rope* (talking about an electrical cord)

(f) *the oval is the big one and the other part is what take to [demonstrates holding the handle of a brush] (talking about a Christmas tree stand)*

F In recent studies of classroom second language learning, there has been a lot more attention paid to how teachers provide feedback to students.

(i) Using the descriptions of different types of feedback provided in (1)–(5), try to analyze the teacher reactions presented in (a)–(f) as responses to the student who said: *I should be student now.*

(ii) Do you think that any of these types of feedback would be more effective or more beneficial than the others?

   (a) *You know, you have to include an article here and say “a student.”*
   
   (b) *I'm sorry, could you say that again?*
   
   (c) *No, say, “I should be studying now.”*
   
   (d) *Do you mean that you want to be a student now?*
   
   (e) *You're saying you should be studying now?*

(1) Clarification request: checking if the teacher has heard/understood the student

(2) Elicitation: trying to get the student to make another attempt or rephrase without the perceived mistake
Explicit correction: clearly changing the student utterance to correct a perceived mistake

Explicit mention of a rule: stating a rule that is involved in the correction of a perceived mistake

Recasts: reformulating the student’s utterance without the perceived mistake

One feature of interlanguage grammars is the apparent existence of temporary rules that don’t match the rules of either the L1 or the L2, as described in Gass and Selinker (2008). The following examples are from a speaker whose L1 was Arabic. Can you describe the rule(s) he seems to be using for the use of plural -s?

(a) How many brother you have?
(b) The streets are very wide.
(c) I finish in a few day.
(d) Here is a lot of animal in the houses.
(e) Many people live in villages.
(f) There are two horses in the picture.
(g) Both my friend from my town.
(h) Seven days in a week.

What is contrastive analysis and how might it help us understand the following types of L2 errors in English produced by students whose L1 is Spanish?

(a) He must wear the tie black.
(b) My study is modernes languages.
(c) He no understand you.
(d) It was the same size as a ball of golf.
(e) We stayed at home because was raining.
(f) I eat usually eggs for breakfast.

Discussion Topics/Projects

I Which of the following statements do you agree with? What reasons would you give to support your opinions?

(1) People with high IQs are good language learners.
(2) Most mistakes in the L2 are due to interference from the L1.
(3) L2 learners should not be allowed to hear mistakes or they will learn them.
(4) Teachers should teach simple L2 structures before complex ones.
(5) Teachers should teach only one L2 grammatical rule at a time and practice it thoroughly before introducing the next rule.

(For background reading, see chapter 7 of Lightbown and Spada, 2013.)

II “Communicative Language Teaching is premised on the assumption that learners do not need to be taught grammar before they can communicate but will acquire it naturally as part of the process of learning to communicate. In some versions of Communicative Language Teaching, then, there is no place at all for the direct teaching of grammar.” (Ellis, 1997)

(a) Do you believe that second language learning is possible with only a focus on function (“communication”) and no focus on form (“grammar”)?

(b) Why do you think that there are renewed calls for “form-focused instruction” after many years of Communicative Language Teaching?

(For background reading, see chapter 9 of Ellis, 1997.)

Seidlhofer, B. (2011) *Understanding English as a Lingua Franca* Oxford University Press
This old lady, in her nineties, but sharp as a pin, would sometimes fall into a peaceful reverie. As she did so, she might have seemed to be knitting, her hands in constant complex motion. But her daughter, also a signer, told me she was not knitting but thinking to herself, thinking in Sign. And even in sleep, I was further informed, the old lady might sketch fragmentary signs on the counterpane. She was dreaming in Sign.

Sacks (1989)

When we considered the process of language acquisition, we concentrated on the fact that what is naturally acquired by most children is speech. Yet this is not the only way
that a first language can be acquired. Just as most children of English-speaking or
Spanish-speaking parents naturally acquire English or Spanish at a very early age, so
the deaf children of deaf parents naturally acquire sign (or sign language). Later in
life, as Oliver Sacks observed, they may even use sign when they “talk” in their sleep.
If those children grow up in American homes, they will typically acquire American
Sign Language, also known as Ameslan or ASL, as their version of sign. With a
signing population of at least half a million, and perhaps as many as two million, ASL
is a widely used language in the United States. The size of this population is quite
remarkable since, until relatively recently, the use of ASL was discouraged in most
educational institutions for the deaf. In fact, historically, very few teachers of the deaf
learned ASL, or even considered it to be a “real” language at all. For many people, sign
wasn’t language, it was “merely gestures.”
Gestures

Although both sign and gestures involve the use of the hands (with other parts of the body), they are rather different. Sign is like speech and is used instead of speaking. Gestures are mostly used while speaking. Examples of gestures are making a downward movement with one hand while talking about not doing very well in a class or making a twisting motion with one hand as you describe trying to open a bottle or jar. The gestures are just part of the way in which meaning is expressed and can be observed while people are speaking and signing.

In the study of non-verbal behavior, a distinction can be drawn between gestures and emblems. Emblems are signals such as “thumbs up” (= things are good) or “shush” (= keep quiet) that function like fixed phrases and do not depend on speech. Emblems are conventional and depend on social knowledge (e.g. what is and isn’t considered offensive in a particular situation). In Britain, the use of two fingers (the index and middle fingers) raised in a V-shape represents one emblem (= victory) when the back of the hand faces the sender and a quite different emblem (= I insult you in a very offensive way) when the back of the hand faces the receiver of the signal. It is important, when in different places, not to mix up the local emblems.
Iconics

Within the set of gestures that accompany speech, we can distinguish between those that echo, in some way, the content of the spoken message and those that indicate something being referred to. Iconics are gestures that seem to be a reflection of the meaning of what is said, as when we trace a square in the air with a finger while saying *I’m looking for a small box*. By itself, an iconic gesture doesn’t “mean” the same as what is said, but it may add “meaning.” In one particularly clear example (from McNeill, 1992), a woman was moving her forearm up and down, with a closed hand, as if holding a weapon, while saying *and she chased him out again*. The message, with weapon (an umbrella), was created via speech and gesture combined.
Deictics

Another common group of gestures are described as deictics. As noted in Chapter 10, the term “deictic” means “pointing.” We can use deictics in the current context, as when we use a hand to indicate a table (with a cake on it) and ask someone Would you like some cake?. We can also use the same gesture and the same table (with cake no longer on it) when we later say That cake was delicious. In this case, the gesture and the speech combine to accomplish reference to something that only exists in shared memory rather than in the current physical space.
Beats
There are other gestures, such as those described as beats, which are short quick movements of the hand or fingers. These gestures accompany the rhythm of talk and are often used to emphasize parts of what is being said or to mark a change from describing events in a story to commenting on those events. As with other gestures, these hand movements accompany speech, but are not typically used as a way of speaking. When hand movements are used in order to “speak,” we can describe them as part of a sign language. (See Tasks A and B, page 232, for more on gestures.)
Types of Sign Languages

There are two general categories of language that involve the use of signs: alternate sign languages and primary sign languages. An alternate sign language is a system of hand signals developed by speakers for limited communication in a specific context where speech cannot be used. These signals are also described as gestural communication to make it clear they are not the same as languages. In some religious orders where there are rules of silence, restricted alternate sign languages are used. The use of signs by monks in Benedictine monasteries during periods of silence has been documented since the Middle Ages. Among some Australian Aboriginal groups, there are periods (e.g. times of bereavement) when speech is avoided completely and quite elaborate alternate sign languages are used instead.

Less elaborate versions are to be found in some special working circumstances. Bookmakers at British racecourses used a system of gestures called “tic-tac” to communicate with each other (and not with the betting public) and whenever there is discussion of commodity prices, the television news usually shows traders in commodity exchanges signaling wildly to each other. In all these examples, the users of alternate sign languages have another first language that they can speak.

In contrast, a primary sign language is the first language of a group of people who do not use a spoken language with each other. British Sign Language (BSL) and French Sign Language (Langue des Signes Française or LSF), as used for everyday communication among members of the deaf communities of Britain and France, are primary sign languages. Contrary to popular belief, these different primary sign languages do not share identical signs and are not mutually intelligible. British Sign Language is also very different from American Sign Language (ASL), which, for historical reasons, has more in common with French Sign Language.

We will focus our attention on ASL in order to describe some features of a primary sign language, but first, we have to account for the fact that, until fairly recently, it was not treated as a possible language at all.
Oralism

It was not until the 1960s that any serious consideration was given to the status of ASL as a natural language, following the work of William Stokoe (1960). Before that, it was genuinely believed by many well-intentioned teachers that the use of sign language by deaf children (being too “easy”) would inhibit the acquisition of the English language. Since spoken English was what those teachers believed the children really needed, a teaching method generally known as oralism dominated deaf education during most of the twentieth century. This method required that the students practice English speech sounds and develop lip-reading skills. Despite its resounding lack of success, the method was never seriously challenged, perhaps because of an insidious belief among many during this period that, in educational terms, most deaf children were not going to achieve very much anyway.

Whatever the reasons, the method produced few students who could speak intelligible English (less than 10 per cent) and even fewer who could lip-read (around 4 per cent). While oralism was failing, the use of ASL was flourishing. Many deaf children of hearing parents actually acquired the banned language at schools for the deaf, not from the teachers, but from other children. Since only one in ten deaf children had deaf parents from whom they acquired sign language, the cultural transmission of ASL has been mostly carried out from child to child.
Substantial changes in deaf education have taken place in recent years, but there is still an emphasis on the learning of English, written rather than spoken. As a result, many institutions promote the learning of what is known as Signed English (also called Manually Coded English or MCE). This is essentially a means of producing signs that correspond to the words in an English sentence, in English word order. In many ways, Signed English is designed to facilitate interaction between the deaf and the hearing community. Its greatest advantage is that it seems to present a much less formidable learning task for the hearing parent of a deaf child and provides the parent with a communication system to use with the child.

For similar reasons, hearing teachers in deaf education can make use of Signed English when they sign at the same time as they speak. It is also easier for those hearing interpreters who produce a simultaneous translation of public speeches or lectures for deaf audiences. Many deaf people actually prefer interpreters to use Signed English because they say there is a higher likelihood of understanding the message. Unless they learned ASL in childhood, few hearing people are proficient enough to translate fairly rapid English speech into idiomatic ASL.
Origins of ASL

It would be very surprising if ASL really was “a sort of gestured version of English,” as some have claimed. Historically, ASL developed from the French Sign Language used in a Paris school founded in the eighteenth century. Early in the nineteenth century, a teacher from this school, named Laurent Clerc, was brought to the United States by an American minister called Thomas Gallaudet who was trying to establish a school for deaf children. Clerc not only taught deaf children, he also trained other teachers. During the nineteenth century, this imported version of sign language, incorporating features of indigenous natural sign languages used by the American deaf, evolved into what became known as ASL. Such origins help to explain why users of ASL and users of BSL (in Britain) do not share a common sign language.
The Structure of Signs

As a natural language functioning in the visual mode, ASL is designed for the eyes, not the ears. In producing linguistic forms in ASL, signers use four key aspects of visual information. These are described as the articulatory parameters of ASL in terms of shape, orientation, location and movement. We can describe these parameters in the use of the common sign for THANK-YOU.
Shape and Orientation

To describe the articulation of THANK-YOU in ASL, we start with the shape, or configuration of the hand(s), used in forming the sign. The shape may differ in terms of which fingers are used, whether the fingers are extended or bent, and the general configurations of the hand(s). The configuration shown in Figure 15.1 is a “flat hand” (not a “fist hand” or a “cupped hand”).

Figure 15.1
The orientation of the hand is “palm up” rather than “palm down” when signing THANK-YOU. In other signs, the hand may be oriented in a number of other ways such as the “flat hand, palm towards signer” form used to indicate MINE.
Location

Each sign has a location in relation to the head and body of the signer. In THANK-YOU, the sign begins near the mouth and is completed at chest level. Some signs can only be distinguished on the basis of location, as in the difference between SUMMER (above the eyes) and UGLY (below the eyes) because hand shape, palm orientation and movement are the same in both. In some two-handed signs (e.g. MEDICINE, SHIP), one hand acts as the base location while the other hand moves on or above it.
Movement

The movement element in THANK-YOU is “out and downward” toward the receiver. The difference between faster and slower movement in signing also has an effect on meaning. In a story recounted by Stokoe (2001), the director of public relations at Gallaudet College (for the deaf) noticed two employees signing one day about a former president who had been very ill. She saw a sign she interpreted as DEAD and phoned the Washington Post, where an obituary for the ex-president appeared the following day. Rather prematurely, as it turned out. The same hand movements, used fairly quickly for DEAD, had actually been used with a much slower rotation to communicate DYING. The difference in movement creates a difference in meaning. Just as there are “slips of the ear” (Chapter 12), there can also be “slips of the eye.”
Primes

The contrasting elements within these four general parameters can be analyzed into sets of features or primes. We say that “flat hand” is a prime in terms of shape and “palm up” is a prime in terms of orientation. Identifying each of these primes allows us to create a complete feature analysis of every sign in much the same way as we can analyze the phonological features of spoken language (see Chapter 4).
Facial Expressions and Finger-Spelling

The fact that a sign language exploits the visual medium in quite subtle ways makes it difficult to represent accurately on the page. As Lou Fant (1977) has observed, “strictly speaking, the only way to write Ameslan is to use motion pictures.” There are important functions served by non-manual components such as head-movement, eye-movement and several specific types of facial expressions. Under normal circumstances, **THANK-YOU** is articulated with a head nod and a smiling face.

Also, if a new term or name is encountered, signers can use **finger-spelling**, which is a system of hand configurations used to represent the letters of the alphabet.

The majority of signs are located around the neck and head. If a sign is made near the chest or waist, it tends to be a two-handed sign. One of the key features of visual messages is that they can incorporate a number of distinct elements simultaneously. Spoken language production is linear, while in the visual medium multiple components can be produced at the same time in space.
Representing Signs

One of the major problems is finding a way to incorporate those aspects of facial expressions that contribute to the message. A partial solution is to write one line of manually signed words (in capital letters) and then, above this line, to indicate the nature and extent of the facial expression that contributes to the message. As shown here, the $q$ in the transcription is used to show that the facial expression (raised eyebrows, widened eyes, head leaning forward) indicated a question function throughout the signing of what would be translated as *Can I borrow the book?*

\[Me\ Borrow\ Book\q\]

**Me Borrow Book**

Other subtle aspects of meaning can be signaled by facial expression. In one study, it was observed that a signer, while telling a story, produced the message: MAN FISH [continuous]. The “continuous” element involves a sweeping repetitive movement of the hands. The basic translation is: *The man was fishing.* However, ASL users translated it as *The man was fishing with relaxation and enjoyment.* This extra information came from a facial expression with the lips together, pushed out a little, and the head tilted. The notation $mm$ signals this element, as in the transcription:

\[Man\ Fish\ [\text{continuous}]\mm\]

**Man Fish [continuous]**
The Meaning of Signs

The signs of ASL are sometimes mistakenly believed to be simple visual representations or “pictures,” and the language is thought to consist of a limited set of primitive gestures that look like objects or mimic actions in pantomime. Interestingly, as non-users of ASL, when we are told that a sign is used to refer to a particular thing, we can often create a symbolic connection that makes the relationship between sign and signified seem obvious. We look at the sign for THANK-YOU and see it as some appropriately symbolic version of the action of “thanking.”

However, most of the time, interpretation doesn’t work that way in the opposite direction. We normally find it difficult to get the meaning of a sign simply on the basis of what it looks like. Indeed, as when confronted with any unfamiliar language, we may not even be able to identify individual signs (words) in fluent signing. Most everyday use of ASL signs is not based on identifying symbolic pictures, but on recognizing familiar linguistic forms that have arbitrary status. As an experiment, try to decide what English word translates the common sign shown in Figure 15.2.
This sign involves rotating both hands together with the fingers interlocked in front of the chest. There are different ideas about the source: “it represents the stripes on a flag” or “it is a mixing pot” or “it is a coming together.” To suggest that any of these images comes into the mind of a signer who uses the sign to refer to America is as absurd as proposing that in hearing the word America, an English speaker must be thinking about Amerigo Vespucci, the Italian whose name is the source of the modern word. The signs in ASL have their meanings within the system of signs, not through reference to some pictorial image each time they are used.
ASL as a Natural Language

Investigations of ASL from a linguistic point of view are a relatively recent phenomenon. Yet it has become clear that any feature that is characteristically found in spoken languages has a counterpart in ASL. All those defining properties of human language described in Chapter 2 are present in ASL. There are equivalent levels of phonology, morphology and syntax. For example, ASL uses Subject Verb Object (SVO) word order like English, but normally puts adjectives after nouns, unlike English, but in the same way as French.

Children acquiring ASL as their first language go through developmental stages similar to children learning spoken language, though the production of signs seems to begin earlier than the production of spoken words. In the hands of witty individuals, ASL is used for a wide range of jokes and “sign play.” There are different ASL dialects in different regions and historical changes in the form of signs can be traced over the past hundred years (older versions are preserved in old films).

In summary, ASL is a natural language that is quite remarkable for its endurance in the face of decades of prejudice and misunderstanding. There is a joke among the deaf that begins with the question: What is the greatest problem facing deaf people? Perhaps increased knowledge of their language will bring about a change in the old response to that question. The traditional answer was: Hearing people.
Study Questions

1. In the study of non-verbal behavior, what are emblems?

2. What is the difference between “iconics” and “deictics” in the study of gestures?

3. What is an alternate sign language?

4. What is the major difference between ASL and Signed English?

5. What percentage of deaf students were able to develop lip-reading skills through oralism?

6. Historically, how many deaf children were born to deaf parents?

7. What was the name of the American minister who established the first school for deaf children in the USA?

8. If the signs used in HE WATCH TV are accompanied by sweeping repetitive movement of the hands, what is the English translation?

9. Which articulatory parameters of ASL have “flat hand” and “palm up” as primes?

10. What would be the most likely English translation of:

   (a)

   ![Happen Yesterday Night]

   Happen Yesterday Night

   (b)

   ![Boy Not Walk [continuous]]

   Boy Not Walk [continuous]
Tasks

A In the chapter, we mentioned deictics or pointing gestures, but didn’t explore how they are actually performed. Can you describe in detail the most common pointing gesture? Are there any social constraints on its use? Are there other ways of pointing, using other parts of the body?

B Is gesture tied to self-expression or is it tied to communication with a listener? For example, do we gesture more when a listener is present in person or out of view (e.g. during a phone call)? Do blind people gesture when they're talking?

C What is the connection between deaf education and the invention of the telephone?

D What made people have such a strong commitment to oralism despite its lack of success?

E What is the basis of the distinction between “prelinguistic“ and “postlinguistic” hearing impairment?

F What is “dactylology” and what is the main difference between American and British varieties?

G Unlike spoken language use where accompanying facial expressions seem to be optional most of the time, ASL is a visual language and facial expressions are an essential part of what is being communicated. What facial expressions would conventionally be associated with signing the following sentences?

(1) *Are you married?*

(2) *Where do you work?*

(3) *You like jazz, I'm surprised.*

(4) *If I miss the bus, I'll be late for work.*
Discussion Topics/Projects

I Which of the following statements do you agree with and what reasons would you give to support your opinion?

(1) A shrugging gesture always indicates “helplessness” of some kind.

(2) The eyebrow flash is used everywhere as a greeting.

(3) It is easier to learn foreign gestures than foreign words.

(4) Brow lowering carries an implication of something negative whereas brow raising implies something positive.

(5) If a person uses lots of hand movements, such as smoothing the hair or touching the chin while speaking, it’s an indication that the person is telling a lie.

(For background reading, see Ekman, 1999.)

II According to Corballis, “there are good reasons to suppose that much of the development of language over the past two million years took place through manual gesture rather than vocalization” (2002: 98).

What do you think of the idea that the origins of language are to be found in manual gestures and that the development of speech comes from the transfer of manual gestures to oral gestures? Is it relevant that the hands of early humans developed well before the capacity for speech? What about the fact that children communicate non-verbally (e.g. pointing) before they produce speech?

(For background reading, see chapter 5 of Corballis, 2002.)

Written Language
The five-year-old child whose skills in symbolic representation are displayed here seems to be already familiar with some of the basic elements of writing. The sequence of letters goes from left to right, each letter is distinct from the next and generally well formed, and each word is separated from the next by larger spaces. The occasional spelling “mistake,” a traditional problem in written English, cannot disguise the fact that this child has already learned how to write.
Writing

We can define writing as the symbolic representation of language through the use of graphic signs. Unlike speech, it is a system that is not simply acquired, but has to be learned through sustained conscious effort. Not all languages have a written form and, even among people whose language has a well-established writing system, there are large numbers of individuals who cannot use the system.

In terms of human development, writing is a relatively recent phenomenon. We may be able to trace human attempts to represent information visually back to cave drawings made at least 20,000 years ago, or to clay tokens from about 10,000 years ago, which appear to have been an early attempt at bookkeeping, but these artifacts are best described as ancient precursors of writing. The earliest writing for which we have clear evidence is known as “cuneiform,” marked on clay tablets about 5,000 years ago. About 3,000 years ago, inscriptions were being used in an ancient script that has a more obvious connection to writing systems in use today. We know that we must have lost a lot of earlier inscriptions on perishable material, but working from the surviving inscriptions, we can trace the development of one writing tradition, lasting a few thousand years, with which humans have sought to create a more permanent record of what was going on.
Pictograms

Cave drawings may serve to record some event (e.g. Humans 3, Buffaloes 1), but they are not usually thought of as any type of specifically linguistic message. They are usually treated as part of a tradition of pictorial art. When some of the “pictures” came to represent particular images in a consistent way, we can begin to describe the product as a form of picture-writing, or pictograms. Modern pictograms, as in Figure 16.2, are language-independent and can be understood with the same conventional meaning in a lot of different places where a number of different languages are spoken.

Figure 16.2
Ideograms

Whereas the images presented in Figure 16.2 continue to reflect the physical forms of objects, we typically interpret them in a way that goes beyond simply recognizing those objects. That is, the picture of a cup (with saucer) doesn’t just let us know that there is a cup in this location. That would be an odd interpretation because mostly we are not just looking for a cup, but also something to put in that cup, such as coffee or tea, and maybe something to go with it, such as cake or cookies (none of which is included in the picture). We actually interpret the images, not as objects, but as symbols of the objects, with meanings associated with the symbol that may not be tied to the object.

At some point in the early development of pictorial representation, a symbol such as ☀ came into use for referring to the sun. An essential part of this use of a representative symbol is that everyone should use a similar form to convey a roughly similar meaning. In time, this picture might develop into a more fixed symbolic form, such as ☀️, and come to be used for “heat” and “daytime,” as well as for “sun.” Note that as the symbol extends from “sun” to “heat,” it is moving from something visible to something conceptual (and no longer a simple picture). This type of symbol is then considered to be part of a system of idea-writing, or ideograms. The distinction between pictograms and ideograms is essentially a difference in the relationship between the symbol and the entity it represents. The more “picture-like” forms are pictograms and the more abstract derived forms are ideograms. A key property of both pictograms and ideograms is that they do not represent words or sounds in a particular language.

It is generally thought that there were pictographic or ideographic origins for a large number of symbols that turn up in later writing systems. For example, in Egyptian hieroglyphics, the symbol ☨ was used to refer to a house and derived from the diagram-like representation of the floor plan of a house. In Chinese writing, the character 水 was used for a river, and had its origins in the pictorial representation of a stream flowing between two banks. However, it is important to note that neither the Egyptian nor the Chinese written symbols are actually “pictures” of a house or a river. They are more abstract. When we create symbols in a writing system, there is always an abstraction away from the physical world.

When the relationship between the symbol and the entity or idea becomes sufficiently abstract, we can be more confident that the symbol is probably being used to represent words in a language. In early Egyptian writing, the ideogram for water was ☕️. Much
later, the derived symbol came to be used for the actual word meaning “water.” When symbols are used to represent words in a language, they are described as examples of word-writing, or “logograms.”
Logograms

An early example of logographic writing is the system used by the Sumerians, living in Mesopotamia, in the southern part of modern Iraq, around 5,000 years ago. Because of the particular shapes used in their symbols, these inscriptions are more generally described as cuneiform writing. The term cuneiform (from Latin cuneus, “wedge”) means “wedge-shaped” and the inscriptions used by the Sumerians were produced by pressing a wedge-shaped implement into soft clay tablets that created a permanent symbol when the clay hardened, resulting in forms such as 🍗.

The form of this symbol really gives no clue to what type of entity is being referred to. The relationship between the written form and the object it represents has become arbitrary and we have a clear example of word-writing or a logogram. The cuneiform symbol above can be compared to a typical pictographic representation of the same fishy entity: 🐟.

We can also compare the ideogram for the sun, presented earlier as ☀, with the logogram used to refer to the same entity found in cuneiform writing: ☀️.

Modern logograms in English are forms such as $, 8, &, where each symbol represents one word, as is also the case with @, now one of the most commonly used logograms (in email addresses). A more elaborate writing system that is based, to a certain extent, on the use of logograms can be found in China. Many Chinese written symbols, or characters, are used as representations of the meaning of words, or parts of words, and not of the sounds of spoken language. In some treatments, this type of writing is technically described as “morphographic,” because the symbols have come to be used for morphemes rather than words. (See Chapter 6 for the distinction between words and morphemes.) One of the advantages of such a system is that two speakers of very different dialects of Chinese, who might have great difficulty understanding each other’s spoken forms, can both read the same written text. Chinese writing, with the longest continuous history of use as a writing system (i.e. 3,000 years), clearly has many other advantages for its users.

One major disadvantage is that quite a large number of different written symbols are required within this type of writing system, although the official “list of modern Chinese characters for everyday use” is limited to 2,500 characters. (Other lists contain up to 50,000 characters.) Remembering large numbers of different composite word-symbols, however, does seem to present a substantial memory load, and the history of most other writing systems illustrates a development away from logographic writing. To accomplish this, some
principled method is needed to go from symbols representing words (i.e. a logographic system) to a set of symbols that represent sounds (i.e. a phonographic system).
Phonographic Writing

The development from pictographic representation to logographic writing, even among the Sumerians, did not take place without some symbols being used in a similar way if certain words had similar sounds (not meanings). Following Gelb (1963), we can observe this process taking place as the physical shape in the form of an arrow (🚀) was first used in representations of the word for “arrow” (tà), then later adopted for the more abstract concept “life” (tà), simply because both words sounded the same. Similarly, the symbol (🌿) for a physical object “reed” (gi) is taken over for the abstract concept “reimbursement” (gi) on the basis of similar pronunciations. In this development, the symbols are adopted to represent the sounds of the words, also known as phonographic writing.
The Rebus Principle

This general pattern of using existing symbols to represent the sounds of words in a language is often described in terms of a process known as the rebus principle. In this process, the symbol for one entity is taken over as the symbol for the sound of the spoken word (or part of it) used to refer to that entity. That symbol then comes to be used whenever that sound occurs in any words.

We can create an example, working with the sound of the English word *eye*. We can imagine how the pictographic representation ☀️ could have developed into the logogram 🌒. This logogram is pronounced as *eye* and, with the rebus principle at work, you could then refer to yourself as 🌒 (“I”), to one of your friends as 🌒 (“Crosseye”), combine the form with the logogram for “deaf” to produce “defy,” with the logogram for “boat” to produce “bow-tie,” and so on.

A similar process is taking place in contemporary English texting where the symbol “2” is used, not only as a number, but as the sound of other words or parts of words, in messages such as the one on the left below (“(I) need to speak to you tonight”). In this message, the letter “u” also illustrates the process of rebus writing, having become the symbol for the sound of the spoken word “you,” as also illustrated in the other example, with “c” and “8” also representing sounds.

| nd2spk2u2nite | cul8r |

Let’s take another, non-English, example, in which an ideogram 🍃 becomes the logogram 🥂, for the word pronounced *ba* (meaning “boat”). We can then produce a symbol for the word pronounced *baba* (meaning “father”) which would be 🥂. One symbol can thus be used in many different ways, with a range of meanings. This process substantially reduces the number of symbols needed in a writing system.
Syllabic Writing

In the last example, the symbol that is used for the pronunciation of parts of a word represents a unit (ba) that consists of a consonant sound (b) and a vowel sound (a). This unit is one type of syllable, described in Chapter 4. When a writing system employs a set of symbols, each one representing the pronunciation of a syllable, it is described as syllabic writing.

There are no purely syllabic writing systems in use today, but modern Japanese can be written with a set of single symbols representing spoken syllables, called “hiragana,” and is consequently often described as having a (partially) syllabic writing system, or a syllabary.

In the early nineteenth century, a Cherokee named Sequoyah, living in North Carolina, invented a syllabic writing system that was widely used within the Cherokee community to create written messages from the spoken language. Papers with writing were described as “talking leaves.” In the Cherokee examples below, we can see that the written symbol in each case does not correspond to a single consonant (C) or a single vowel (V), but to a syllable (CV).

Both the ancient Egyptian and the Sumerian writing systems evolved to the point where some of the earlier logographic symbols were being used to represent spoken syllables. However, it is not until the time of the Phoenicians, inhabiting what is modern Lebanon between 3,000 and 4,000 years ago, that we find the full use of a syllabic writing system. Many of the symbols that the Phoenicians used were taken from earlier Egyptian writing. The Egyptian form (meaning “house”) was adopted in a slightly reoriented form as . After being used logographically for the word pronounced (still meaning “house”), the symbol came to represent other syllables beginning with a b sound. Similarly, the Egyptian form (meaning “water”) turns up as and is used for syllables beginning with an m sound.

So, a word that might be pronounced as muba could be written as , and the pronunciation bima could be written as . Note that the direction of writing is from
right to left, as it still is in the writing system of modern Arabic. By about 3,000 years ago, the Phoenicians had stopped using logograms and had a fully developed syllabic writing system.
Alphabetic Writing

If you have a set of symbols being used to represent syllables beginning with, for example, a \( b \) sound or an \( m \) sound, then you are actually very close to a situation in which the symbols can be used to represent single sound types in a language. This is, in effect, the basis of the type of writing used in an alphabet. In principle, an alphabet is a set of written symbols, each one representing a single type of sound or phoneme. (See Chapter 4 for a description of phonemes.) The situation just described is what occurred in the development of the writing systems of Semitic languages such as Arabic and Hebrew. Words written in these languages, in everyday use, largely consist of symbols for the consonant sounds in the word, with the appropriate vowel sounds being supplied by the reader (or rdr).

This type of writing system is sometimes called a consonantal alphabet. The early version of Semitic alphabetic script, originating in the writing system of the Phoenicians, is the basic source of most other alphabets to be found in the world. Modified versions can be traced to the East into Iranian, Indian and South-East Asian writing systems and to the West through Greek. The basic order of letter symbols in the first “A-B-C-D … ” was created about three thousand years ago by the Phoenicians and continues to be used as our primary ordering device for lists in everything from dictionaries to telephone directories to grades for academic performance.

The early Greeks took the alphabetizing process a stage further by using separate symbols to represent the vowel sounds as distinct entities, and so created a remodeled system with vowel symbols. This change resulted in the Phoenician consonant “alep” becoming a symbol for a vowel sound as \( A \) (“alpha”) to go with existing symbols for consonant sounds such as \( B \) (“beta”), giving us single-sound writing or an “alphabet.” In fact, for some writers, it is the Greeks who should be given credit for taking the inherently syllabic system from the Phoenicians and creating a writing system with the single-symbol to single-sound correspondence fully realized as alphabetic writing.

From the Greeks, this revised alphabet passed to the rest of Western Europe through the Romans. As a result, we talk about the Roman alphabet as the writing system used for English. Another line of development took the same basic Greek writing system into Eastern Europe where Slavic languages were spoken. The modified version, called the Cyrillic alphabet (after St. Cyril, a ninth-century Christian missionary), is the basis of the writing system used in Russia today.
The actual form of a number of letters in modern European alphabets can be traced from their origins in Egyptian hieroglyphics through Phoenician and Greek to the symbols we use today. The examples in Figure 16.3 are based on Davies (1987).

Figure 16.3
Written English

If indeed the origins of the alphabetic writing system were based on a correspondence between a single symbol and a single sound type, then one might reasonably ask why there is such a frequent mismatch between the forms of written English (“you know”) and the sounds of spoken English (“yu no” or /ju noʊ/). Other languages (Italian, Spanish) have writing systems that stick much more closely to the one sound-one symbol principle of alphabetic writing. English is not always so consistent. As we noted in Chapter 3, there is a lot of variation in how each sound of contemporary spoken English is represented in writing. The vowel sound represented by /i/ is written in various ways, as shown in the first two columns on the left below, and the consonant sound represented by /ʃ/ has various spellings, as in the other two columns.

| i (critique) | ee (queen) | s (sugar) | ch (champagne) |
| ie (belief) | eo (people) | ss (tissue) | ce (ocean) |
| ei (receipt) | ey (key) | ssi (mission) | ci (delicious) |
| ea (meat) | e (scene) | sh (Danish) | ti (nation) |
English Orthography

As we have just seen, English orthography (or spelling) is subject to a lot of variation. Notice how often a single phoneme in the two lists is actually represented by more than one letter. Part of the reason for this is that the English language is full of words borrowed, often with their spelling, from other languages, as in *ph* for /f/ in the Greek borrowings *alphabet* and *orthography*, where two letters are used for a single sound. A combination of two letters consistently used for a single sound, as in *phl/f/ and *shf/s/ is called a digraph.

The English writing system is alphabetic in a very loose sense. Some reasons for this irregular correspondence between sound and symbolic representation may be found in a number of historical influences on the form of written English. The spelling of written English was largely fixed in the form that was used when printing was introduced into fifteenth-century England. At that time, there were a number of conventions regarding the written representation of words that had been derived from forms used in writing other languages, notably Latin and French. For example, *qu* replaced older English *cw* in words like *queen*. Moreover, many of the early printers were native Flemish speakers and could not make consistently accurate decisions about English pronunciations, hence the change from Old English *gast* to *ghost*, with *b* derived from the Flemish version (*gheest*).

Perhaps more important is the fact that, since the fifteenth century, the pronunciation of spoken English has undergone substantial changes. For example, although we no longer pronounce the initial *k* sound or the internal *gh* sound, we still include letters indicating the older pronunciation in our contemporary spelling of the word *knight*. These are sometimes called “silent letters.” They also violate the one sound-one symbol principle of pure alphabetic writing, but not with as much effect as the silent final -e of so many English words. Not only do we have to learn that this letter is not pronounced, we also have to know the patterns of influence it has on the preceding vowel, as in the different pronunciations of *a* in the pair *hat/hate* and *o* in *not/note*.

If we then add in the fact that a large number of older written English words were actually “recreated” by sixteenth-century spelling reformers to bring their written forms more into line with what were supposed, sometimes erroneously, to be their Latin origins (e.g. *dette* became *debt, doute* became *doubt, iland* became *island*), then the sources of the mismatch between written and spoken forms begin to become clear. Further changes in the development of North American English spelling conventions are illustrated in Task D, on page 245.
In Chapter 17, we will look more closely at other aspects of the historical development of English and other ways in which languages change.
Study Questions

1. Why is one early writing system called “cuneiform”?

2. What is the basic difference between a logographic writing system and a phonographic writing system?

3. What happens in the process of change based on the rebus principle?

4. Is the text message “cu@9” an example of logographic or alphabetic writing?

5. What is the name given to the writing system used for Russian?

6. Where will you find the writing system with the longest history of continuous use?

7. What is the best way to describe the written symbols used in Chinese writing: pictographic or phonographic or morphographic?

8. Which of these symbols ($, 8, ?, &) is not used as a logogram?

9. Which people created the basic order of letter symbols (A, B, C, D)?

10. What is a digraph?
Tasks

A What is boustrophedon writing and during which period was it used?

B What kind of writing system is Hangul, where is it used and how are forms written on the page?

C What kind of writing is used in texting? How would you describe the writing conventions (pictographic, ideographic, logographic, syllabic or alphabetic) that are used in the following text messages?

`xlnt msg` (“excellent message”)  `swdyt` (“So, what do you think?”)

`btw` (“by the way”)  `ne1` (“anyone”)

`b42moro` (“before tomorrow”)  `cul8r ;-)” (“see you later, wink”)  

D When we reviewed English orthography, we didn’t consider the differences that developed between North American and British English, exemplified in the spelling of the word *programme*, used in the UK, versus *program* in the USA.

(i) From the following list, identify the eleven words that are distinctly American in spelling, the eleven words that are distinctly British, and the six words that are spelled the same in both varieties.

(ii) Can you identify the six regular distinctions in spelling (e.g. `-mme` versus `-m`) that are illustrated in the list?

E What kind of writing systems are known as abjads and abugidas and what is the basic difference between them?

F In contemporary usage, written language is not simply spoken language written down. There are many differences between the way we create written texts and the way we have conversations, for example. Based on their corpus research, Biber et al. (1999) described a number of “lexical bundles,” that is, sequences of four or more words that regularly occur together, some in speech and others in writing.

(i) Can you reorganize the following lexical bundles into two groups, one containing expressions that are typical of informal spoken English and the other containing expressions more typical of written English in an educational setting?

G Consider the following examples and try to decide in which cases “X” is a symbol with a function, but without meaning, or one with an identifiable general meaning, or one with a very specific meaning. Can any of the uses be considered logographic?

(1) *The twenty-fourth letter of the English alphabet is X.*

(2) *On the map was a large X and the words “You are here.”*
(3) Most of the older men were illiterate at that time and put X where their signature was required.

(4) Indicate your choice by putting X next to only one of the following options.

(5) He wrote X – Y = 6 on the blackboard.

(6) There was an image of a dog with a large X across it.

(7) The teacher put X beside one of my sentences and I don’t know why.

(8) We can’t take the children with us to see that film because it’s rated X.

(9) The witness known as Ms. X testified that she had heard several gunshots.

(10) Aren’t there two X chromosomes in the cells of females?

(11) At the bottom of the letter, after her signature, she put X three times.

(12) In the XXth century, Britain’s collapsing empire brought new immigrants.

The accompanying illustration (Figure 16.4) is described in Jensen (1969) as a letter from a young woman of the Yukagirs who live in northern Siberia. The woman (c) is sending the letter to “her departing sweetheart” (b). What do you think the letter is communicating? Who are the other figures? What kind of “writing” is this?
Discussion Topics/Projects

I According to Florian Coulmas (2003: 201), “the present distribution of scripts testifies to the close link between writing systems and religion.” Do you think that the spread of different religions (more than anything else) accounts for the different forms of writing used in the world today? What kind of evidence would you use to argue for or against this idea?

(For background reading, see chapter 10 of Coulmas, 2003.)

II Pictograms may be language-independent, but they do not seem to be culture-independent. In order to interpret many pictographic and ideographic representations, we have to be familiar with cultural assumptions about what the symbols “mean.”

(i) As a simple exercise, show the twelve symbols illustrated below (Figure 16.5) to some friends and ask them if they know what each one means. (People may say they have never seen them before, but they should be encouraged to guess.)

(ii) Next, provide them with the following list of “official meanings” and ask them to decide which symbol goes with which meaning.

This barely recognizable version of the Lord’s Prayer from about a thousand years ago provides a rather clear indication that the language of the “Englisc” has gone through substantial changes to become the English we use today. Investigating the features of older languages, and the ways in which they developed into modern languages, involves us in the study of language history and change, also known as philology. In the nineteenth century, philology dominated the study of language and one result was the creation of “family trees” to show how languages were related. Before all of that could happen, however, there had to be the discovery that a variety of languages spoken in different parts of the world were actually members of the same family.
Family Trees

In 1786, a British government official in India called Sir William Jones made this observation about Sanskrit, the ancient language of Indian law (Lehman, 1967: 10):

*The Sanskrit language, whatever be its antiquity, is of a wonderful structure; more perfect than the Greek, more copious than the Latin, and more exquisitely refined than either, yet bearing to both of them a stronger affinity, both in the roots of verbs and in the forms of grammar, than could possibly have been produced by accident.*

Sir William went on to suggest, in a way that was quite revolutionary for its time, that languages from very different geographical areas must have some common ancestor. It was clear, however, that this common ancestor could not be described from any existing records, but had to be hypothesized on the basis of similar features existing in records of languages that were believed to be descendants.

During the nineteenth century, a term came into use to describe that common ancestor. It incorporated the notion that this was the original form (*Proto*) of a language that was the source of modern languages in the Indian sub-continent (*Indo*) and in Europe (*European*). With *Proto-Indo-European* established as a long ago “great-great-grandmother,” scholars set out to identify the branches of the Indo-European family tree, tracing the lineage of many modern languages. Figure 17.1 shows a small selection of the Indo-European languages in their family branches.
Figure 17.1
Indo-European

Indo-European is the language family with the largest population and distribution in the world, but it is not the only one. There are about thirty such language families containing a large number of different individual languages. According to one reputable source (Ethnologue, 2015), there are actually 7,102 known languages in the world. Many of these languages are in danger of extinction while a few are expanding. In terms of number of speakers, Chinese has the most native speakers (over 1 billion), while Spanish (over 400 million) and English (over 330 million) are more widely used in different parts of the world.

Looking at the Indo-European family tree, we might be puzzled initially by the idea that all these diverse languages are related. After all, two modern languages such as Italian and Hindi would seem to have nothing in common. One way to get a clearer picture of how they are related is through looking at records of an older generation, like Latin and Sanskrit, from which the modern languages evolved. For example, if we use familiar letters to write out the words for father and brother in Sanskrit, Latin and Ancient Greek, some common features become apparent.

(“father”)

(“brother”)

While these forms have clear similarities, it is extremely unlikely that exactly the same words will be found throughout the languages. However, the fact that close similarities occur (especially in the pronunciations of the words) is good evidence for proposing a family connection. For more examples, see Task C, on page 263.
Cognates

The process we have just used to establish a possible family connection between different languages involved looking at what are called “cognates.” Within groups of related languages, we can often find close similarities in particular sets of words. A cognate of a word in one language (e.g. English) is a word in another language (e.g. German) that has a similar form and is (or was) used with a similar meaning. The English words *mother*, *father* and *friend* are cognates of the German words *Mutter*, *Vater* and *Freund*. On the basis of these cognates, we can see that Modern English and Modern German must have a common ancestor in the Germanic branch of Indo-European. We can look at similar sets in the Italic branch of Indo-European and find cognates in Spanish (*madre*, *padre*, *amigo*) and Italian (*madre*, *padre*, *amico*).
Comparative Reconstruction

Using information from sets of cognates from different (but apparently related) languages, we can embark on a procedure called comparative reconstruction. The aim of this procedure is to reconstruct what must have been an earlier or even the possible “proto” form in the common ancestral language. In carrying out this procedure, we can make use of two very general principles.

The majority principle is very straightforward. If, in a cognate set, three words begin with a [p] sound and one word begins with a [b] sound, then our best guess is that the majority have retained the original sound (i.e. [p]).

The most natural development principle is based on the fact that certain types of sound change are very common, as shown in Table 17.1, whereas changes in the other direction are extremely unlikely.

<td>ripa → riva</td>
</tr>
<tr>
<td>4    Consonants become voiceless at the end of words</td>

</tr>
</tbody>
</table>
Comparing Cognates

If we take some examples of cognates from three languages, as shown below, we can make a start on comparative reconstruction by deciding what was the most likely form of the initial sound in the original source of all three. Since the written forms can often be misleading, we check that the initial sounds of the words in languages A and B are all [k], while in language C, the initial sound in all the words is [ʃ].

Sound Reconstruction

Within the small set of languages just presented, the majority principle would be used to argue that the initial sound [k] in languages A and B is older than the [ʃ] sound in language C. Adding support to this analysis, the [k] sound is a stop consonant and the /ʃ/ sound is a fricative. According to one part of the “most natural development principle” (in Table 17.1), change occurs in the direction of stops becoming fricatives, so the [k] sound is more likely to have been the original.

We have started on the comparative reconstruction of the common origins of some words in Italian (A), Spanish (B) and French (C). In this case, we have a way of checking our reconstruction because the common origin for these three languages is known to be Latin. When we check the Latin cognates of the words listed, we find cantare, catena, carus and caballus, confirming that [k] was the initial sound.
Word Reconstruction

Looking at a non-Indo-European set of cognates, we can imagine receiving the following data from a linguist recently returned from an expedition to a remote region of the Amazon. The examples are a set of cognates from three related languages, but what would the proto-forms have looked like?

Using the majority principle, we can suggest that the older forms will most likely be based on language 2 or language 3. If this is correct, then the consonant changes must have been \([p] \rightarrow [b], [t] \rightarrow [d] \text{ and } [k] \rightarrow [ɡ]\) in order to produce the later forms in language 1. There is a pattern in these changes: voiceless sounds became voiced between vowels. So, languages 2 and 3 have older forms than language 1.

Which of the two lists, 2 or 3, contains the older forms? Remembering one other “most natural development” type of sound change (i.e. final vowels often disappear), we can propose that the words in language 3 have consistently lost the final vowels still present in the words of language 2. Our best guess, then, is that the forms listed for language 2 are closest to what must have been the original proto-forms.
The History of English

The reconstruction of proto-forms is an attempt to determine what a language must have been like before any written records. However, even when we have written records from an older period of a language such as English, they may not bear any resemblance to the written form of the language found today. The version of the Lord’s Prayer quoted at the beginning of this chapter provides a good illustration of this point. Even some of the letters seem quite alien. The older letters þ (called “thorn”) and ð (“eth”) were both replaced by “th” (as in þu → thou, eorðan → earth), and æ (“ash”) simply became “a” (as in to dæg → today). To see how one language has undergone substantial changes through time, we can take a brief look at the history of English, which is traditionally divided into four periods:

Old English: before 1100
Middle English: 1100 to 1500
Early Modern English: 1500 to 1700
Modern English: after 1700
The primary sources for what developed as the English language were the Germanic languages spoken by tribes of Angles, Saxons and Jutes from northern Europe who moved into the British Isles in the fifth century. In one early account, these tribes were described as “God’s wrath toward Britain.” It is from the names of the first two that we have the term Anglo-Saxons to describe these people, and from the first tribe that we get the word for their language Englisc and their new home Engla-land.

From this early version of Englisc, now called Old English, we have many of the most basic terms in the language: mann (“man”), wif (“woman”), cild (“child”), hūs (“house”), mete (“food”), etan (“eat”), drincan (“drink”) and feohtan (“fight”). These pagan invaders did not remain pagan for long. From the sixth to the eighth century, there was a period during which these Anglo-Saxons were converted to Christianity and a number of terms from Latin (the language of the religion) came into English at that time. The origins of the contemporary English words angel, bishop, candle, church, martyr, priest and school all date from this period.

From the eighth century through the ninth and tenth centuries, another group of northern Europeans came first to plunder and then to settle in parts of the coastal regions of Britain. They were the Vikings and it is from their language, Old Norse, that the original forms of give, law, leg, skin, sky, take and they were adopted, along with the weekdays Tiw’s day and Thor’s day. It is from their winter festival jól that we have Yule as a term for the Christmas season.
Middle English

The event that marks the end of the Old English period, and the beginning of the Middle English period, is the arrival of the Norman French in England, after their victory at Hastings under William the Conqueror in 1066. These French-speaking invaders became the ruling class, so that the language of the nobility, government, law and civilized life in England for the next two hundred years was French. It is the source of words like army, court, defense, faith, prison and tax.

Yet the language of the peasants remained English. The peasants worked on the land and reared sheep, cows and swine (words from Old English) while the upper classes talked about mutton, beef and pork (words of French origin). Hence the different terms in Modern English to refer to these creatures “on the hoof” as opposed to “on the plate.”

Throughout this period, French (or, more accurately, an English version of French) was the prestige language and Chaucer tells us that one of his Canterbury pilgrims could speak it.

*She was cleped Madame Eglentyne*

*Ful wel she song the service dyvyne,*

*Entuned in her nose ful semely,*

*And Frenche she spak ful faire and fetisly.*

This is an example of Middle English from the late fourteenth century. It had changed substantially from Old English, but other changes were yet to take place. Most significantly, the vowel sounds of Chaucer’s time were very different from those we hear in similar words today. Chaucer lived in a “hoos,” with his “weef,” and “hay” might drink a bottle of “weena” with “heer” by the light of the “mona.”

In the two hundred years, from 1400 to 1600, that separated Chaucer and Shakespeare, the sounds of English underwent a substantial change known as the “Great Vowel Shift.” The effects of this general raising of long vowel sounds (such as long [o] moving up to long [u], as in *mōna* → *moon*) made the pronunciation of Early Modern English, beginning around 1500, significantly different from earlier periods. The introduction of printing in 1476 brought about significant changes, but because the printers tended to standardize existing pronunciations in the spelling of words (e.g. knee,
gnaw), later pronunciation changes are often not reflected in the way Modern English (after 1700) is written.

Those changes reflecting influences from the outside (borrowed words from Norman French or Old Norse) are examples of external change. Other changes (especially sound changes) are the result of processes of internal change.
Sound Changes

In a number of changes from Middle to Modern English, some sounds disappeared from the pronunciation of certain words, in a process simply described as sound loss. The initial [h] of many Old English words was lost, as in hlud → loud and hlaford → lord. Some words lost sounds, but kept the spelling, resulting in the “silent letters” of contemporary written English. Word-initial velar stops [k] and [ɡ] are no longer pronounced before nasals [n], but we still write the words knee and gnaw with the remnants of earlier pronunciations.

Another example is a velar fricative [x] that was used in the pronunciation of the older form niht as [nɪxt] (closer to the modern German pronunciation of Nacht), but is absent in the contemporary form night, pronounced as [naɪt]. A remnant of this type of sound is still present in some dialects, as at the end of the Scottish word loch, but it is no longer a consonant in most dialects of Modern English.
Metathesis

The sound change known as metathesis involves a reversal in position of two sounds in a word. This type of reversal is illustrated in the changed versions of these words from their earlier forms.

<table>
<thead>
<tr>
<th>Metathesis Examples</th>

</tr>
<tr>
<td>bridd → bird</td>
</tr>
<tr>
<td>hros → horse</td>
</tr>
<tr>
<td>waps → wasp</td>
</tr>
</tbody>
</table>

The cowboy who pronounces the expression pretty good as something close to purty good is producing a similar example of metathesis as a dialect variant within Modern English. In some American English dialects, the form aks, as in I aksed him already, can still be heard instead of ask.

The reversal of position in metathesis can sometimes occur between non-adjoining sounds. The Spanish word palabra is derived from the Latin parabola through the reversal in position of the [l] and [r] sounds. The pattern is exemplified in the following set.

<table>
<thead>
<tr>

Epenthesis

Another type of sound change, known as epenthesis, involves the addition of a sound to the middle of a word.

\[
\begin{array}{ccc}
\text{æmtig} & \rightarrow & \text{empty} \\
\text{spinel} & \rightarrow & \text{spindle} \\
\text{timr} & \rightarrow & \text{timber}
\end{array}
\]

The addition of a [p] sound after the nasal [m], as in *empty*, can also be heard in some speakers’ pronunciation of *something* as “sumpthing.” Anyone who pronounces the word *film* as if it were “filum,” or *arithmetic* as “arithametic,” is producing examples of epenthesis in Modern English.
Prothesis

One other type of sound change worth noting, though not found in English, involves the addition of a sound to the beginning of a word and is called prothesis. It is a common feature in the evolution of some forms from Latin to Spanish.

Spanish speakers who are starting to learn English as a second language will sometimes put a prothetic vowel at the beginning of some English words, with the result that words like strange and story may sound like “estrange” and “estory.”
Syntactic Changes

Some noticeable differences between the structure of sentences in Old and Modern English involve word order. In Old English texts, we find the Subject–Verb–Object (or SVO) order most common in Modern English, but we can also find a number of different orders that are no longer used. For example, the subject could follow the verb, as in *ferde he* (“traveled he”), and the object could be placed before the verb, as in *he hine geseah* (“he him saw”), or at the beginning of the sentence, as in *him man ne sealde* (“[to] him man not gave [any]”).

In the last example, the use of the negative also differs from Modern English, since the sequence *not gave (ne sealde)* is no longer grammatical. A “double negative” construction was also possible, as in *ne sealdest þū næfre* (“not gave you never”), where both *ne* (“not”) and *næfre* (“never”) are used with the same verb. We would now say *You never gave* rather than *You not gave never.*
Loss of Inflections

In the following Old English sentence, we can see how all these distinct syntactic features result in a word order that is quite different from a Modern English version (“and you never gave me a kid”). Note that the word order is Verb–Subject–Object, or VSO, in contrast to the SVO of the contemporary language.

</tr>
</tbody>
</table>

This example also gives a hint of the most sweeping change in the form of English sentences from the older period. This was the loss of a large number of inflectional suffixes from many parts of speech. Notice that, in the previous examples, the forms sealde (“he gave”) and sealdest (“you gave”) are differentiated by inflectional suffixes (-e, -est) that are no longer used in Modern English. Nouns, adjectives, articles and pronouns all had different inflectional forms according to their grammatical function in the sentence. (For more examples of changes, see Task E, on page 263.)
Semantic Changes

The most obvious way in which Modern English differs from Old English is in the number of borrowed words that have come into the language since the Old English period. (For more on borrowing, see Chapter 5.) Less obviously, many words have ceased to be used. Since we no longer carry swords (most of us, at least), the word \textit{foin}, meaning “the thrust of a sword,” is no longer heard. A common Old English word for “man” was \textit{were}, but it has fallen out of use, except in horror films where the compound \textit{werewolf} occasionally appears. A number of expressions such as \textit{lo}, \textit{verily} or \textit{egad} are immediately recognized as belonging to a much earlier period, along with certain medieval-sounding names such as \textit{Bertha}, \textit{Egbert} and \textit{Percival}. 

Broadening of Meaning

Another process is described as broadening of meaning, as in the change from holy day as a religious feast to the break from work called a holiday. We have broadened the use of foda (fodder for animals) to all kinds of food. Old English words such as luflic (“loving”) and hrad (“quick”) not only went through sound changes, they also developed more complex evaluative meanings (“wonderful” and “preferentially”), as in their modern uses: That’s a lovely idea, but I’d rather have the money. Another example is the modern use of the word dog. We use it very generally to refer to all breeds, but in its older form (Old English docga), it was only used for one breed.
Narrowing of Meaning

The reverse process, called narrowing, has overtaken the Old English word *hund*, once used for any kind of dog, but now, as *hound*, used only for some specific breeds. Another example is *mete*, once used for any kind of food, which has in its modern form *meat* become restricted to only some specific types. The Old English version of the word *wife* could be used to refer to any woman, but has narrowed in its application nowadays to only married women. This type of change can take a word with a negative meaning, derived from Latin *nescius* (from *ne* + *sci*) meaning “not knowing” or “ignorant”, and over time give it more positive meaning in the modern word *nice*. A different kind of narrowing can lead to a negative meaning for some words, such as *notorious* (which used to mean “widely known,” but now means “known for something bad”), *vulgar* (which used to mean simply “ordinary”) and *naughty* (which used to mean “having nothing”).
Diachronic and Synchronic Variation

None of these changes happened overnight. They were gradual and probably difficult to discern while they were in progress. Although some changes can be linked to major social changes caused by wars, invasions and other upheavals, the most pervasive source of change in language seems to be in the continual process of cultural transmission (described in Chapter 2). Each new generation has to find a way of using the language of the previous generation. In this unending process whereby each individual child has to “recreate” the language of the community, there is an unavoidable propensity to pick up some elements exactly and others only approximately. There is also the occasional desire to be different. Given this tenuous transmission process, it should be expected that languages will not remain stable and that change and variation are inevitable.

In this chapter, we have concentrated on variation in language viewed diachronically, that is, from the historical perspective of change through time. The type of variation that can be viewed synchronically, that is, in terms of differences within one language in different places and among different groups at the same time, is the subject of Chapters 18 and 19.

Tasks

A Which of these languages cannot be included in the Indo-European family tree? To which other language families do they belong?

Catalan, Chamorro, Faroese, Georgian, Hebrew, Hungarian, Marathi, Serbian, Tamil, Turkish

B A Danish linguist, Rasmus Rask, and a German writer more famous for fairy tales, Jacob Grimm, both working in the early nineteenth century, are credited with the original insights that became known as “Grimm’s Law.”

What is Grimm’s Law and how does it account for the different initial sounds in pairs of cognates such as these from French and English (deux/two, trois/three) and these from Latin and English (pater/father, canis/bound, genus/kin)?

C We can often trace the roots of several different words in Modern English back to a single Indo-European form. Using what you learned in this chapter, can you complete the following chart, using the words provided, to illustrate several English word histories?

\[
\text{corage, coraticum, cord, cordialis, heorte, herton, kardia, kardiakos, kerd}
\]

D Describe what happened in any documented case of “language death.”

E These four versions of the same biblical event (Matthew 27: 73) are presented in Campbell (2013) as a way of illustrating some changes in the history of English. Can you describe the changes in vocabulary and grammar?

(i) Modern English (1961)
Shortly afterwards the bystanders came up and said to Peter, “Surely you are another of
them; your accent gives you away!”

(i) Early Modern English (1611)

And after a while came unto him they that stood by, and saide to Peter, Surely thou also
art one of them, for thy speech bewrayeth thee.

(ii) Middle English (1395)

And a litil aftir, thei that stooden camen, and seiden to Petir, treuli thou art of hem; for
thi speche makith thee knowun.

(iii) Old English (1050)

þa æfter lytlum fyrste genêalæton þa ðe þær stodon, cwædon to petre. Sodlice þu eart of
hym, þyn spræc þe gesweotolad.

(Literally: “then after little first approached they that there stood, said to Peter. Truly thou
art of them, thy speech thee makes clear.”)

F What happens in the process of change known as “grammaticalization”? Can you find
out how the grammaticalization process made it possible for the English verb forms go and
will to be used in sentences such as I’m gonna be late and I’ll be at work until six?

G During the late eighteenth century when Captain Cook’s voyages in the Pacific brought
him to Hawai’i, he and his crew were surprised to discover that many Hawaiian words were
similar to those they had learned from other Pacific island groups thousands of miles away.
This similarity is now known to be a result of a number of Pacific languages having a
common ancestor, called Proto-Polynesian.

(i) In Table 17.2, based on Kikusawa (2005), there are examples from five Polynesian
languages. Can you work out the most likely forms of Proto-Polynesian based on these
cognates? (The symbol ′, as in wɨdə, represents a consonant called a glottal stop [ʔ],
described in Chapter 3.)

you work out the most likely Hawaiian cognates of these Tongan words?

Discussion Topics/Projects

I A nineteenth-century scholar named Curtius (quoted in Aitchison, 2013) described a major goal of historical linguistics in the following way:

A principal goal of this science is to reconstruct the full, pure forms of an original stage from the variously disfigured and mutilated forms which are attested in the individual languages.

Do you agree that languages decay and become worse (“disfigured and mutilated”) through time? What kind of evidence would you use to argue for or against this point of view? (For background reading, see chapter 16 of Aitchison, 2013.)

II Using what you have learned about comparative reconstruction, try to recreate the most likely proto-forms for these cognates (from Sihler, 2000: 140).

Tonouchi (2001)
Throughout this book, we have been talking about languages such as English, Spanish or Swahili as if there was a single variety of each in everyday use. That is, we have largely ignored the fact that every language has a lot of variation, especially in the way it is spoken. If we just look at English, we find widespread variation in the way it is spoken in different countries such as Australia, Britain and the USA. We can also find a range of varieties in different parts of those countries, with Lee Tonouchi’s account of “Trick-O-Treat” in Hawai‘i as just one example. In this chapter, we investigate aspects of language variation based on where that language is used, as a way of doing linguistic geography. First, we should identify the particular variety that we have normally assumed when we referred to a language as English, Spanish or Swahili.
The Standard Language

When we talked about the words and structures of a language in earlier chapters, we were concentrating on the features of only one variety, usually called the standard language. This is actually an idealized variety, because it has no specific region. It is the variety associated with administrative, commercial and educational centers, regardless of region. If we think of Standard English, it is the version we believe is found in printed English in newspapers, books and the mass media in general. It is the variety used in most works of fiction, in scientific and other technical articles, and the one taught in most schools. It is the variety we normally try to teach to those who want to learn English as a second or foreign language. It is clearly associated with education and broadcasting in public contexts and is more easily described in terms of features associated with the written language (i.e. vocabulary, spelling, grammar) than the spoken language.

If we are thinking of that general variety used in mainstream public broadcasting in the United States, we can refer more specifically to Standard American English or, in Britain, to Standard British English. In other parts of the world, we can talk about other recognized varieties such as Standard Australian English, Standard Canadian English or Standard Indian English.
Accent and Dialect

Whether we think we speak a standard variety of English or not, we all speak with an accent. It is a myth that some speakers have accents while others do not. We might feel that some speakers have very distinct or easily recognized types of accent while others may have more subtle or less noticeable accents, but every language-user speaks with an accent. Technically, the term “accent” is restricted to the description of aspects of pronunciation that identify where an individual speaker is from, regionally or socially. It is different from the term dialect, which is used to describe features of grammar and vocabulary as well as aspects of pronunciation.

We recognize that the sentence You don’t know what you’re talking about will generally “look” the same whether spoken with an American accent or a Scottish accent. Both speakers will be using forms associated with Standard English, but have different pronunciations. However, this next sentence – Ye dinnae ken whit yer haverin’ aboot – has the same meaning as the first, but has been written out in an approximation of what a person who speaks one dialect of Scottish English might say. There are differences in pronunciation (e.g. ye, whit, aboot), but there are also examples of different vocabulary (e.g. ken, haverin’) and different grammatical forms (dinnae, yer).
Variation in Grammar

While differences in vocabulary are often easily recognized, dialect variations in the meaning of grammatical constructions are less frequently documented. In the following example (from Trudgill, 1983) two British English speaking visitors (B and C) are talking to a local Irish English speaker (A) in Donegal, Ireland.

A: *How long are youse here?*

B: *Till after Easter.*

(Speaker A looks puzzled.)

C: *We came on Sunday.*

A: *Ah. Youse’re here a while then*

It seems that the construction *How long are youse here?*, in speaker A’s dialect, is used with a meaning close to the structure “How long have you been here?” referring to past time. Speaker B, however, answers as if the question was referring to future time (“How long are you going to be here?”). When speaker C answers with a past time response (*We came on Sunday*), speaker A acknowledges it and repeats his use of a present tense (*Youse’re here*) to refer to past time. Note that the dialect form *youse* (= “you” plural) seems to be understood by the visitors though it is unlikely to be part of their own dialect.
Dialectology

Despite occasional difficulties, there is a general impression of mutual intelligibility among many speakers of different dialects of English. This is one of the criteria used in the study of dialects, or dialectology, to distinguish between two different dialects of the same language (whose speakers can usually understand each other) and two different languages (whose speakers can’t usually understand each other). This is not the only, or the most reliable, way of identifying dialects, but it is helpful in establishing the fact that each different dialect, like each language, is equally worthy of analysis. It is important to recognize, from a linguistic point of view, that none of the varieties of a language is inherently “better” than any other. They are simply different.

From a social point of view, however, some varieties do become more prestigious. In fact, the variety that develops as the standard language has usually been one socially prestigious dialect, originally associated with a center of economic and political power (e.g. London for British English and Paris for French). Yet there always continue to be other varieties of a language spoken in different regions.
Regional Dialects

The existence of different regional dialects is widely recognized and often the source of some humor for those living in different regions. In the United States, people from the Brooklyn area of New York may joke about a Southerner’s definition of sex by telling you that sex is fo’ less than tin, in their best imitation of someone from the Southern states. In return, Southerners can wonder aloud about what a tree guy is in Brooklyn, since they have heard Brooklyn speakers refer to doze tree guys. Some regional dialects clearly have stereotyped pronunciations associated with them.

Going beyond stereotypes, those involved in the serious investigation of regional dialects have devoted a lot of survey research to the identification of consistent features of speech found in one geographical area compared to another. These dialect surveys often involve a lot of attention to detail and operate with very specific criteria in identifying acceptable informants. After all, it is important to know if the person whose speech you are recording really is a typical representative of the region’s dialect.

Consequently, the informants in the dialect surveys of the twentieth century tended to be NORMS or “non-mobile, older, rural, male speakers.” Such speakers were selected because they were less likely to have influences from outside the region in their speech. One unfortunate consequence of using such criteria is that the resulting dialect description tends to be more accurate of a period well before the time of investigation. Nevertheless, the detailed information obtained has provided the basis for a number of Linguistic Atlases of whole countries (e.g. England) and regions (e.g. the Upper Midwest area of the United States).
Isoglosses

We can look at some examples of regional variation found in a survey that resulted in the Linguistic Atlas of the Upper Midwest of the United States. One of the aims of a survey of this type is to find a number of significant differences in the speech of those living in different areas and to be able to chart where the boundaries are, in dialect terms, between those areas. If it is found, for example, that the vast majority of informants in one area say they carry things home from the store in a *paper bag* while the majority in another area say they use a *paper sack*, then it is usually possible to draw a line across a map separating the two areas, as shown in Figure 18.1. This line is called an *isogloss* and represents a boundary between the areas with regard to that one particular linguistic item. If a very similar distribution is found for other items, such as a preference for *pail* to the north and *bucket* to the south, then other isoglosses can be drawn on the map.

![Figure 18.1](image)
Dialect Boundaries

When a number of isoglosses come together in this way, a more solid line, indicating a dialect boundary, can be drawn. In Figure 18.1, a small circle indicates where paper bag was used and a plus sign shows where paper sack was used. The broken line between the two areas is an isogloss that coincides with enough other isoglosses involving other linguistic features to be classified as a dialect boundary. Using this information, we find that in the Upper Midwest of the USA there is a Northern dialect area that includes Minnesota, North Dakota, most of South Dakota and Northern Iowa. The rest of Iowa and Nebraska show characteristics of the Midland dialect. Some of the noticeable differences are illustrated here.

So, if an American English (male) speaker pronounces the word greasy as [ɡrizi] and asks for a bucket to carry water, then he is not likely to have grown up and spent most of his life in Minnesota. While making this general claim, we shouldn’t forget that a number of the features in the dialect survey won’t necessarily be used by all speakers currently living in the region.
The Dialect Continuum

Another note of caution is required with regard to dialect boundaries. The drawing of dialect boundaries is quite useful in establishing a broad view of regional dialects, but it tends to obscure the fact that, in the boundary areas, one dialect or language variety merges into another. Regional variation actually exists along a dialect continuum rather than having sharp breaks from one region to the next.

A very similar type of continuum can occur with related languages existing on either side of a political border. As you travel from the Netherlands into Germany, you will find concentrations of Dutch speakers giving way to areas near the border where “Dutch” may sound more like “Deutsch” because the Dutch dialects and the German dialects are less clearly differentiated. Then, as you travel further into Germany, greater concentrations of distinctly German speakers occur.

Speakers who move back and forth across this border area, using different varieties with some ease, may be described as bidialectal (i.e. “speaking two dialects”). Most of us grow up with some form of bidialectalism, speaking one dialect “in the street” among family and friends, and having to learn another dialect “in school.” However, in some places, there are two different languages involved and the people who know both languages are described as bilingual.
Bilingualism

In many countries, regional variation is not simply a matter of two (or more) dialects of a single language, but can involve two (or more) quite distinct and different languages. Canada, for example, is officially a bilingual country, with both French and English as official languages. This recognition of the linguistic rights of the country’s French speakers, largely in Quebec, did not come about without a lot of political upheaval. For most of its history, Canada was essentially an English-speaking country, with a French-speaking minority group. In such a situation, bilingualism at the level of the individual tends to be a feature of the minority group. In this form of bilingualism, a member of a minority group grows up in one linguistic community, mainly speaking one language (e.g. Welsh in Britain or Spanish in the United States), but learns another language (e.g. English) in order to take part in the larger dominant linguistic community.

Indeed, many members of linguistic minorities can live their entire lives without ever seeing their native language in the public domain. It is only relatively recently that bilingual (English–Welsh) road signs came into widespread use in Wales. Many henoed never expected to see their first language on public signs in Wales, as in Figure 18.2, though they may wonder why everyone is being warned about them.
Diglossia

A rather special situation involving two distinct varieties of a language, called *diglossia*, exists in some countries. In diglossia, there is a “low” variety, acquired locally and used for everyday affairs, and a “high” or special variety, learned in school and used for important matters. A type of diglossia exists in Arabic-speaking countries where the high variety (Classical Arabic) is used in formal lectures, serious political events and especially in religious discussions. The low variety is the local version of the language, such as Egyptian Arabic or Lebanese Arabic. Through a long period in European history, a diglossic situation existed with Latin as the high variety and one of the local languages of Europe (early versions of modern Italian, French and Spanish) as the low variety or “vernacular.”
Language Planning

Perhaps because bilingualism in contemporary Europe and North America tends to be found mostly among minority groups, many countries are often assumed to be monolingual. For many of those residents who are only capable of speaking one language (English), the United States would indeed seem to be a monolingual country. For others, it clearly is not, because they live in large communities where English is not the first language of the home. As one example, the majority of the population in San Antonio, Texas, will be more likely to listen to radio broadcasts in Spanish than in English. This simple fact has quite large repercussions in terms of the organization of local representative government and the educational system. Should elementary school teaching take place in Spanish or English?

Consider a similar question in the context of Guatemala, a country in Central America, where there are twenty-six Mayan languages spoken, as well as Spanish. If, in this situation, Spanish is selected as the language of education, are all those Mayan speakers put at an early educational disadvantage within the society? Questions of this type require answers on the basis of some type of language planning. Government, legal and educational organizations in many countries have to plan which variety or varieties of the languages spoken in the country are to be used for official business. In Israel, despite the fact that it was not the most widely used language among the population, Hebrew was chosen as the official government language. In India, the choice was Hindi, yet in many non-Hindi-speaking regions, there were riots against this decision. There were “National Language Wars” in the Philippines before different groups could agree on the name of the national language (Filipino).

The process of language planning may be seen in a better light when the full series of stages is implemented over a number of years. The adoption of Swahili as the national language of Tanzania in East Africa may serve as a good example. There still exist a large number of other languages, as well as the colonial vestiges of English, but the educational, legal and government systems have gradually introduced Swahili as the official language. The process of “selection” (choosing an official language) is followed by “codification,” in which basic grammars, dictionaries and written models are used to establish the standard variety. The process of “elaboration” follows, with the standard variety being developed for use in all aspects of social life and the appearance of a body of literary work written in the
standard. The process of “implementation” is largely a matter of government attempts to encourage use of the standard, and “acceptance” is the final stage when a substantial majority of the population use the standard and think of it as the national language, playing a part in not only social, but also national identity.
Pidgins

In some areas, the standard chosen may be a variety that originally had no native speakers in the country. For example, in Papua New Guinea, with more than eight hundred different languages, a lot of official business is conducted in Tok Pisin. This language is now used by over a million people, but it began many years earlier as a kind of impromptu language called a pidgin. A variety of a language described as a pidgin is often discussed as a “contact” language that developed for some practical purpose, such as trading, among groups of people who had a lot of contact, but who did not know each other’s languages. As such, it would have no native speakers. The origin of the term “pidgin” is thought to be from a Chinese version of the English word “business.”

A pidgin is described as an “English pidgin” if English is the lexifier language, that is, the main source of words adopted in the pidgin. It doesn’t mean that those words will have the same pronunciation or meaning as in the source. For example, the word gras has its origins in the English word “grass,” but in Tok Pisin it also came to be used for “hair.” It is part of mausgras (“moustache”) and gras bilong fes (“beard”). In Tok Pisin, a distinction developed between yumi (“me and you”) and mipela (“me and others”), marking two different senses of “we” not found in standard English.

There are several English pidgins still used today. They are characterized by an absence of any complex grammatical morphology and a somewhat limited vocabulary. Inflectional suffixes such as -s (plural) and -’s (possessive) are required on nouns in standard English, but are rare in English pidgins, while structures like tu buk (“two books”) and di gyal place (“the girl’s place”) are common. The -ed suffix of standard English is typically missing, so that items for sale may appear on signs as smoke meat and pickle mango. Functional morphemes often take the place of inflectional morphemes found in the source language. For example, instead of changing the form of you to your, as in the English phrase your book, English-based pidgins use a form like bilong, and change the word order to produce phrases like buk bilong yu, as well as gras bilong fes. (For more examples, see Task E, page 280.)

The syntax of pidgins can be quite unlike the languages from which terms were borrowed and modified, as in this example from an earlier stage of Tok Pisin.

“Your head will soon get well again”

There are between 6 and 12 million people still using pidgin languages and between ten and seventeen million using descendants from pidgins called “creoles.”
Creoles

When a pidgin develops beyond its role as a trade or contact language and becomes the first language of a social community, it is described as a creole. Tok Pisin is now a creole. The first language of a large number of people in Hawai‘i is also a creole and, though still locally referred to as “Pidgin,” is more accurately described as “Hawai‘i Creole English.” (See Task C, page 279.) A creole initially develops as the first language of children growing up in a pidgin-using community and becomes more complex as it serves more communicative purposes. Unlike pidgins, creoles have large numbers of native speakers and are not restricted at all in their uses. Haiti has a French creole and Jamaica and Sierra Leone have English creoles.

The separate vocabulary elements of a pidgin can become grammatical elements in a creole. The form baimbai yu go (“by and by you go”) in early Tok Pisin gradually shortened to bai yu go, and finally to yu bigo, with a grammatical structure not unlike that of its English translation equivalent, “you will go.” (See Task B, page 279.)
The Post-Creole Continuum

In many contemporary situations where creoles evolved, there is usually evidence of another process at work. Just as there was development from a pidgin to a creole, known as creolization, there is now often a retreat from the use of the creole by those who have greater contact with a standard variety of the language. Where education and greater social prestige are associated with a “higher” variety (e.g. British English in Jamaica), a number of speakers will tend to use fewer creole forms and structures. This process, known as decreolization, leads at one extreme to a variety that is closer to the external standard model and leaves, at the other extreme, a basic variety with more local creole features. Between these two extremes may be a range of slightly different varieties, some with many and some with fewer creole features. This range of varieties, evolving after (= “post”) the creole has come into existence, is called the post-creole continuum.

So, in Jamaica, one speaker may say a fi mi buk dat, using the basic creole variety, another may put it as iz mi buk, using a variety with fewer creole features, and yet another may choose it's my book, using a variety with only some pronunciation features of the creole, or a “creole accent.” It is also very common for speakers to be able to use a range of varieties in different situations.

These differences are naturally connected to social values and social identity. While discussing language varieties in terms of regional differences, we have excluded the complex social factors that also determine language variation. In Chapter 19, we will investigate the influence of a number of these social variables.
Study Questions

1. Which variety of English would you say is being used in the introductory quotation from Lee Tonouchi?

2. What is the difference between an accent and a dialect?

3. In the following example from Irish English is the speaker referring to future time or past time?

Discussion Topics/Projects

I Peter Trudgill has noted that “increased geographical mobility during the course of the twentieth century led to the disappearance of many dialects and dialect forms through a process we can call dialect levelling – the levelling out of differences between one dialect and another” (2000: 155).

Do you think that “dialect levelling” is continuing in the geographical area you are most familiar with? Does this mean that there will eventually be only one dialect? What other forces might be at work that would cause new dialects to emerge?

(For background reading, see chapter 8 of Trudgill, 2000.)

II English is not the official language of the United States, but some insist that it should be. What are the arguments for and against the “English-Only Movement”?

When at Niagara Falls, I was escorting a young lady with whom I was on friendly terms. She had been standing on a piece of rock, the better to view the scene, when she slipped down, and was evidently hurt by the fall; she had in fact grazed her shin. As she limped a little in walking home, I said, “Did you hurt your leg much.” She turned from me, evidently much shocked, or much offended; and not being aware that I had committed any very heinous offence, I begged to know what was the reason of her displeasure. After some hesitation, she said that as she knew me well, she would tell me that the word *leg* was never mentioned before ladies.

Marryat (1839)
In the preceding chapter, we focused on variation in language use found in different geographical areas. However, not everyone in a single geographical area speaks in the same way in every situation. As Captain Marryat learned, in the quotation above (cited in Mohr, 2013: 192), some individuals can have very specific views on socially appropriate language. We are also aware of the fact that people who live in the same region, but who differ in terms of education and economic status, often speak in quite different ways. Indeed, these differences may be used, implicitly or explicitly, as indications of membership in different social groups or speech communities. A speech community is a group of people who share a set of norms and expectations regarding the use of language. The study of the linguistic features that have social relevance for participants in those speech communities is called “sociolinguistics.”
Sociolinguistics

The term sociolinguistics is used generally for the study of the relationship between language and society. This is a broad area of investigation that involves the interaction of linguistics with a number of other academic disciplines that look at language in its social context such as anthropology, sociology and social psychology. We use all these connections when we analyze language from a social perspective.
Social Dialects

Whereas the traditional study of regional dialects tended to concentrate on the speech of people in rural areas, as noted in Chapter 18, the study of social dialects has been mainly concerned with speakers in towns and cities. In the social study of dialect, it is social class that is mainly used to define groups of speakers as having something in common. The two main groups are generally identified as “middle class,” those who have more years of education and perform non-manual work, and “working class,” those who have fewer years of education and perform manual work of some kind. So, when we refer to “working-class speech,” we are talking about a social dialect. The terms “upper” and “lower” are used to subdivide the groups, mainly on an economic basis, making “upper-middle-class speech” another type of social dialect or sociolect.

As in all dialect studies, only certain features of language use are treated as relevant in the analysis of social dialects. These features are pronunciations, words or structures that are regularly used in one form by working-class speakers and in another form by middle-class speakers. In Edinburgh, Scotland, for example, the word *home* is regularly pronounced as [heɪm], as if rhyming with *fame*, among lower-working-class speakers, and as [hɒm], as if rhyming with *foam*, among middle-class speakers. It is a small difference in pronunciation, but it is an indicator of social status. It may also serve as a subtle indicator of social identity, used subconsciously by some speakers to mark who they are, or who they are not. A more familiar example might be the verb *ain’t*, as in *I ain’t finished yet*, which is more often a feature of working-class speech than middle-class speech.

When we look for other examples of language use that might be characteristic of a social dialect, we treat class as the social variable and the pronunciation or word as the linguistic variable. We can then investigate any systematic variation in usage by counting how often speakers in each class use each version of the linguistic variable. This is rarely an all-or-nothing situation, so we usually find that one group uses a certain form more or less than another and not that only one group or the other uses the form exclusively. (Task F, page 295, has examples of these variables.)
Education and Occupation

Although the unique circumstances of every life result in each of us having an individual way of speaking, a personal dialect or *idiolect*, we generally tend to sound like others with whom we share similar educational backgrounds and/or occupations.

Among those who leave the educational system at an early age, there is a general pattern of using certain forms that are relatively infrequent in the speech of those who go on to complete college. Expressions such as those contained in *Them boys throwed somethin’* or *It wasn’t us what done it* are generally associated with speakers who have spent less time in education. Those who spend more time in the educational system tend to have more features in their spoken language that derive from a lot of time spent with the written language, so that *threw* is more likely than *throwed* and *who* occurs more often than *what* in references to people.

As adults, the outcome of our time in the educational system is usually reflected in our occupation and socio-economic status. The way bank executives, as opposed to window cleaners, talk to each other usually provides linguistic evidence for the significance of these social variables. In the 1960s, sociolinguist William Labov combined elements from place of occupation and socio-economic status by looking at pronunciation differences among salespeople in three New York City department stores (see Labov, 2006). They were Saks Fifth Avenue (with expensive items, upper-middle-class status), Macy’s (medium priced, middle-class status) and Klein’s (with cheaper items, working-class status). Labov went into each of these stores and asked salespeople specific questions, such as *Where are the women’s shoes?*, in order to elicit answers with the expression *fourth floor*. This expression contains two opportunities for the pronunciation (or not) of *postvocalic* /t/, that is, the /t/ sound after a vowel.

In the department stores, there was a regular pattern in the answers. The higher the socio-economic status of the store, the more /t/ sounds were produced, and the lower the status, the fewer /t/ sounds were produced by those who worked there. So, the frequency of this linguistic variable (r) marked the speech as upper middle class, middle class or working class.

In a British study conducted in Reading, about 40 miles west of London, Trudgill (1974) found that the social value associated with the same variable (r) was quite different. Middle-class speakers in Reading pronounced fewer /t/ sounds than working-class speakers. In this particular city, upper-middle-class speakers didn’t seem to pronounce postvocalic /t/
at all. They said things like *Oh, that’s mahvellous, dahling!* The results of these two studies are shown in Table 19.1 (from Romaine, 2000).

Social Markers

As shown in Table 19.1, the significance of the linguistic variable (r) can be virtually the opposite in terms of social status in two different places, yet in both places the patterns illustrate how the use of this particular speech sound functions as a social marker. That is, having this feature occur frequently in your speech (or not) marks you as a member of a particular social group, whether you realize it or not.

There are other pronunciation features that function as social markers. One feature that seems to be a fairly stable indication of lower class and less education, throughout the English-speaking world, is the final pronunciation of -ing with [n] rather than [ŋ] at the end of words such as sitting and thinking. Pronunciations represented by sittin’ and thinkin’ are associated with working-class speech.

Another social marker is called “[h]-dropping,” which makes the words at and hat sound the same. It occurs at the beginning of words and can result in utterances that sound like I’m so ‘angry I could eat an ‘orse. In contemporary English, this feature is associated with lower class and less education. It seems to have had a similar association as a social marker for Charles Dickens, writing in the middle of the nineteenth century. He used it as a way of indicating that the character Uriah Heep, in the novel David Copperfield, was from a lower class, as in this example (from Mugglestone, 1995).

“I am well aware that I am the umblest person going,” said Uriah Heep, modestly;

“… My mother is likewise a very umble person. We live in a umble abode, Master Copperfield, but we have much to be thankful for. My father’s former calling was umble.”

There are also several grammatical features that have been identified as more typically working class than middle class in studies of British English: he’s went to bed already (“gone”), we never done that (“did), I seen her at the shops (“saw”), we was too late (“were”), he don’t know how (“doesn’t”). As with the pronunciation features, these different grammatical forms may also serve as social markers.
Speech Style and Style-Shifting

In his department store study, Labov included another subtle element that allowed him not only to investigate the type of social stratification illustrated in Table 19.1, but also speech style as a social feature of language use. The most basic distinction in speech style is between formal uses and informal uses. Formal style is when we pay more careful attention to how we are speaking and informal style is when we pay less attention. They are sometimes described as “careful style” and “casual style.” A change from one to the other by an individual is called style-shifting.

When Labov initially asked the salespeople where certain items were, he assumed they were answering in an informal manner. After they answered his question, Labov then pretended not to have heard and said, “Excuse me?” in order to elicit a repetition of the same expression, which was pronounced with more attention to being clear. This was taken as a representative sample of the speaker’s more careful style. When speakers repeated the phrase fourth floor, the frequency of postvocalic /r/ increased in all groups. The most significant increase in frequency was among the Macy’s group. In a finding that has been confirmed in other studies, middle-class speakers are much more likely to shift their style of speaking significantly in the direction of the upper middle class when they are using a careful style.

It is possible to use more elaborate elicitation procedures to create more gradation in the category of style. Asking someone to read a short text out loud will result in more attention to speech than simply asking them to answer some questions in an interview. Asking that same individual to read out loud a list of individual words taken from the text will result in even more careful pronunciation of those words and hence a more formal version of the individual’s speech style.

When Labov analyzed the way New Yorkers performed in these elicitation procedures, he found a general overall increase in postvocalic /r/ in all groups as the task required more attention to speech. Among the lower-middle-class speakers, the increase was so great in the pronunciation of the word lists that their frequency of postvocalic /r/ was actually higher than among upper-middle-class speakers. As other studies have confirmed, when speakers in a middle-status group try to use a prestige form associated with a higher-status group in a formal situation, they have a tendency to overuse the form. This pattern has also been observed in studies of “hypercorrection” (see Chapter 7), where speakers can produce
different forms or odd pronunciations as they shift their speech style to try to “speak better.”

The concept of a “prestige” form, as perceived by members of a particular speech community, is sometimes invoked as a way of explaining the type of style-shifting that is observed in sociolinguistic studies. However, there are different ways of characterizing what is perceived as being prestigious.
Prestige

When certain individuals change their speech in the direction of a form that is more frequent in the speech of those perceived to have higher social status, we are dealing with overt prestige, or status that is generally recognized as “better” or more positively valued in the larger community.

There is, however, another phenomenon called covert prestige. This “hidden” status of a speech style as having positive value may explain why certain groups do not exhibit style-shifting to the same extent as other groups. For example, we might ask why many lower-working-class speakers do not change their speech style from casual to careful as radically as lower-middle-class speakers. The answer may be that they value the features that mark them as members of their own social group. They may value group solidarity (i.e. sounding like those around them) more than upward mobility (i.e. sounding like those above them).

Among younger middle-class speakers, there is often covert prestige attached to features of pronunciation and grammar (I ain’t doin’ nuttin’ rather than I’m not doing anything) that are more often associated with the speech of lower-status groups.
Speech Accommodation

As we look closely at variation in speech style, we can see that it is not only based on speakers' social class and attention to speech, but is also influenced by their perception of their listeners. This type of variation is sometimes described in terms of “audience design,” but is more generally known as speech accommodation, defined as our ability to modify our speech style toward or away from the perceived style of the person(s) we are talking to.
Convergence

We can adopt a speech style that attempts to reduce social distance, described as convergence, and use forms that are similar to those used by the person we are talking to. In the following examples (from Holmes, 2013), a teenage boy is asking to see some holiday photographs. In the first example, he is talking to his friend, and in the second example, he is talking to his friend’s mother. The request is essentially the same, but the style is different as the speaker converges with the speech style of the other.

(to friend) C’mon Tony, gizzalook, gizzalook.

(to friend’s mother) Excuse me. Could I have a look at your photos too, Mrs. Hall?
Divergence

While we may want or try to sound like others in some social interactions to emphasize social closeness, there are other times when we may prefer to create the opposite effect. When a speech style is used to emphasize social distance between speakers, the process is called divergence. We can make our speech style diverge from another’s by using forms that are distinctly different. In the third line of the following example, the Scottish teenager shifts to a speech style with features that differ substantially from the first line (while essentially saying the same thing).

TEENAGER: I can’t do it, sir.

TEACHER: Oh, come on. If I can do it, you can too

TEENAGER: Look, I cannae dae it so …

The sudden divergence in style seems to be triggered not only by a need to add emphasis to his repeated statement, but also by the “We’re the same” claim of his teacher. This teenager is using speech style to mark that they are not the same.
Register

Another influence on speech style that is tied to social identity derives from register. A register is a conventional way of using language that is appropriate in a specific context, which may be identified as situational (e.g. in church), occupational (e.g. among lawyers) or topical (e.g. talking about language). We can recognize specific features that occur in the religious register (*Ye shall be blessed by Him in times of tribulation*), the legal register (*The plaintiff is ready to take the witness stand*) and the linguistics register (*In this dialect there are fewer inflectional suffixes*).
Jargon

One of the defining features of a register is the use of jargon, which is special technical vocabulary, typically nouns (e.g. plaintiff, suffix), associated with a specific area of work or interest. In social terms, jargon helps to create and maintain connections among those who see themselves as “insiders” in some way and to exclude “outsiders.” In many ways, it is the learning of the appropriate jargon of a profession that qualifies an individual as a valid professional within that area of expertise. This exclusive effect of specialized jargon, as in the medical register (e.g. Zanoxyn is a nonsteroidal anti-inflammatory drug for arthritis, bursitis and tendonitis), often leads to complaints about what may seem like “jargonitis.”
Slang

Whereas jargon is specialized vocabulary used by those inside established social groups, often defined by professional status (e.g. legal jargon), slang is more typically used among those who are outside established higher-status groups. Slang, or “colloquial speech,” describes words or phrases that are used instead of more everyday terms among younger speakers and other groups with special interests. The word bucks (for dollars or money) has been a slang expression for more than a hundred years in the United States, but the addition of mega- (“a lot of”) in megabucks is a more recent innovation, along with dead presidents (whose pictures are on paper money) and benjamins (from Benjamin Franklin, on $100 bills).

Like clothing and music, slang is an aspect of social life that is subject to fashion, especially among adolescents. It can be used by those inside a group who share ideas and attitudes as a way of distinguishing themselves from others. As a marker of group identity during a limited stage of life such as early adolescence, slang expressions can “grow old” rather quickly. Older forms for “really good” such as groovy, hip and super were replaced by awesome, rad and wicked which gave way to dope, kickass and phat. A hunk (“physically attractive man”) became a hottie and, instead of something being the pits (“really bad”), the next generation thought it was a bummer, harsh!, or said, That’s sucky!. The difference in slang use between groups divided into older and younger speakers provides some of the clearest support for the idea that age is another important factor involved in the study of social variation in language use. Younger speakers are also much more likely to use taboo terms.
Taboo Terms

The use of slang can vary within the younger social group, as illustrated by the use of obscenities or taboo terms. Taboo terms are words and phrases, often involving body parts, bodily functions and sexual acts, that people avoid for reasons related to religion, politeness and prohibited behavior. They are often swear words, typically “bleeped” in public broadcasting (What the bleep are you doing, you little bleep!) or “starred” in print (S**t! F*** off! You stupid f***ing a**hole!).

In a study of the linguistic differences among “Jocks” (higher status) and “Burnouts” (lower status) in Detroit high schools, Eckert (2000) reported the regular use of taboo words among the “Burnouts,” both males and females. However, among the higher status group (the “Jocks”) males used taboo words only with other males, while females didn’t seem to use them at all. Social class divisions, at least in the use of slang, are already well established during adolescence.
African American English

In much of the preceding discussion, we have been reviewing research on social variation based mainly on examples from British English and what we might call “European” American English. Labeling one general social variety according to the historical origins of the speakers allows us to put it in contrast with another major variety called African American English (AAE). Also known as Black English or Ebonics, AAE is a variety used by many (not all) African Americans in many different regions of the USA. It has a number of characteristic features that, taken together, form a distinct set of social markers.

In much the same way as large geographical barriers, such as oceans, rivers and mountains separating groups of people, foster linguistic differences in regional dialects, social barriers such as discrimination and segregation serve to create marked differences between social dialects. In the case of AAE, those different features have often been stigmatized as “bad” language, following a regular pattern whereby the social practices, especially speech, of dominated groups are treated as “abnormal” by those dominant groups who have decided that they are in charge of defining “normal.” Although AAE speakers continue to experience the effects of discrimination, their social dialect often has covert prestige among younger members of other social groups, particularly with regard to popular music, and certain features of AAE may be used in expressions of social identity by many who are not African American.
The form of AAE that has been most studied is usually described as African American Vernacular English (AAVE). The term “vernacular” has been used since the Middle Ages, first to describe early local versions of the European languages that eventually became French, Italian and Spanish (low prestige) in contrast to Latin (high prestige), then to characterize any non-standard spoken version of a language used by lower-status groups. So, the vernacular is a general expression for a kind of social dialect, typically spoken by a lower-status group, which is treated as “non-standard” because of marked differences from the “standard” language. (See Chapter 18 for more on the concept of the standard language.) As the vernacular language of African Americans, AAVE shares a number of features with other non-standard varieties, such as “Chicano English,” spoken in some Hispanic American communities. Varieties of what has been called “Asian American English” are also characterized by some of the pronunciation features described in studies of this vernacular.
The Sounds of a Vernacular

A pervasive phonological feature in AAVE and other English vernaculars is the tendency to reduce final consonant clusters, so that words ending in two consonants (left hand) are often pronounced as if there is only one (lef han). This can affect the pronunciation of past tense -ed forms in certain contexts, with expressions such as iced tea and I passed the test sounding like ice tea and I pass the tess. This characteristic is shared with many pidgins and creoles, as described in Chapter 18, and has led to the suggestion that AAVE may have initially come into being in a way similar to other English creoles.

Initial dental consonants (think, that) are frequently pronounced as alveolar stops (tink, dat), with the result that the definite article (the) is heard as [də], as in You da man! Other morphological features, such as possessive -’s (John’s girlfriend) and third person singular -s (she loves him), are not typically used (John girlfriend, she love him). Also, when a phrase contains an obvious indication of plural number, the plural -s marker (guys, friends) is usually not included (two guy, one of my friend).
The Grammar of a Vernacular

It is typically in aspects of grammar that AAVE and other vernaculars are most stigmatized as being “illogical” or “sloppy.” One frequently criticized element is the double negative construction, as in He don’t know nothin or I ain’t afraid of no ghosts. Because the negative is expressed twice, these structures have been condemned as “illogical” (since one negative supposedly cancels the other). Yet this feature of AAVE can be found in many other English dialects and in other languages such as French: il ne sait rien (literally, “he not knows nothing”). It was also common in Old English: Ic naht singan ne cuðe (literally, “I not sing not could”). There is nothing inherently illogical about these structures, which can extend to multiple negatives, allowing greater emphasis on the negative aspect of the message, as in He don’t never do nothin.

The “sloppy” criticism focuses on the frequent absence of forms of the verb “to be” (are, is) in AAVE expressions such as You crazy or She workin now. It may be more accurate to say that wherever are and is can be contracted in the casual style of other varieties (You’re crazy, She’s working), they are not articulated in AAVE. Formal styles of Standard English require are and is in such expressions, but many regional varieties do not. Nor do many other languages such as Arabic and Russian require forms of “to be” in similar contexts. This aspect of the structure of AAVE speech can’t be “sloppy” any more than it would be “sloppy” in the everyday talk of Arabic or Russian speakers.

While AAVE speakers don’t include the auxiliary verb is in structures such as She workin now, to describe what is happening currently, they can use be (not is), as in She be workin downtown now, as a way of expressing habitual action, as shown in Table 19.2. That is, the presence or absence of be distinguishes between what is a recurring activity or state and what is currently happening. To talk about a habitual action that started or happened in the past, AAVE uses bin (typically stressed), not was, as in She bin workin there. In effect, the use of habitual be or bin, and the absence of forms of “to be” in present state expressions, are all consistent features in the grammar of AAVE. The negative versions of these verbs are formed with don’t (not doesn’t) and the verb is not used with a contracted negative. So, in AAVE, She don’t be workin is grammatical, whereas *She doesn’t be workin and *She ben’t workin would be considered ungrammatical.

In this discussion, we have focused on the linguistic features of social dialects of different groups. Yet those groups are not only distinguished by the basic language they use, but by more general factors such as beliefs and assumptions about the world and their experience of it. This is usually discussed in terms of “culture,” the subject of Chapter 20.
Study Questions

1 How would you define a “speech community”?

2 What kind of variable is class in the study of language and society?

3 Why did Labov try to elicit answers with the expression fourth floor?

4 Which of these expressions has the most instances of postvocalic /r/: armed robbery or birth order or race car driver or red underwear?

5 In Trudgill’s study of Reading speech, which group produced the fewest instances of postvocalic /r/?

6 In what way can the pronunciation of -ing be a social marker?

7 Among which social group is hypercorrection more likely when more attention is paid to speech?

8 What is the difference between jargon and slang?

9 What is meant by a “register”?

10 In AAVE, what is communicated by be in He don’t be smokin now?
Tasks

The information in Table 19.3, adapted from Cheshire (2007: 164), represents the distribution of some expressions called general extenders in the speech of teenagers (fourteen to fifteen years old) in three different English towns. Examples of general extenders are in the left column of the table and illustrated in these sentences:

*I like watching sport and stuff.*
*I cook occasionally on weekends and things.*
*I think they must’ve broken up or something.*

The numbers in the table represent how often each is used (per 10,000 words) by middle-class and working-class groups of teenagers in each town.

G There is a feature of social interaction among friends in Australian English that is based on a concept called “mateship.” Can you describe the basis of mateship and use it to explain the way in which the friends in the following interaction talk to each other?

Immediately prior to this interaction, Michael and Stacey have been running and Angie has just encouraged Stacey to run faster. Michael then speaks to Angie (as described in Sinkeviciute, 2014: 129).

MICHAEL: hey if you were a singer you’d be called Chubby Checker [hahaha] fat boy not so slim [hahaha]

STACEY: [hahaha]

ANGIE: I’m not fat and I’m not a boy so I don’t understand what’s happening [Stacey pokes Angie’s stomach]

MICHAEL: you’re not slim either [hehehe]

ANGIE: no but I am actually [ha]

MICHAEL: are ya?

ANGIE: yeah

MICHAEL: ok

ANGIE: [smiling voice] let’s compare beer guts hey

MICHAEL: settle down sweetheart we all know what it looks like

ANGIE: [smiles] [runs after Michael] oh you little chubby red-haired man

ANGIE AND MICHAEL: [laugh]

H According to Fought (2003), Chicano English is spoken in the south-western region of the USA by individuals of Mexican-American heritage. Read these statements about Chicano English and try to decide whether you agree or disagree with them.

(1) Chicano English is a dialect of American English.

(2) Chicano English is another term for “Spanglish.”

(3) Chicano English is simply ungrammatical or “broken” English, as exemplified by sentences such as Everybody knew the Cowboys was gonna win again and She don’t know Brenda.
(4) Chicano English is the second language learner’s English of people from countries where Spanish is spoken.

(5) There are no native speakers of Chicano English.
Discussion Topics/Projects

If children move to an area before the age of nine, they are able to “pick up” the local dialect, which their parents do not.

Do you think this statement is true of both regional dialect and social dialect? When and how do you think people develop their social dialects?

(For background reading, see chapter 6 of Brown and Attardo, 2005.)

II From a linguistic point of view, there are no good or bad varieties of a language. However, there is a social process called “language subordination” whereby some varieties are treated as having less value than others. Can you describe how this process works in any social situation you are familiar with?

The Quakers rejected the use of *you* as a polite form of address, and preferred *thou*, which to them signaled intimacy and equality. By refusing to use *you* because they took it as a deferential form of address, the Quakers provoked hostility from others who regarded their behavior as a sign of contempt. The repercussions of such deviant usage were severe for some Quakers such as Richard Davis, who reported that when he addressed the lady of the house in which he worked as *thou*, “she took a stick and gave me such a blow upon my bare head, that made it swell and sore for a considerable time. She was so disturbed by it, that she swore she would kill me.”

Romaine (2000)
The type of sociolinguistic variation described in Chapter 19 is sometimes attributed to cultural differences. It is not unusual to find aspects of language identified as characteristic features of African American culture or European culture or Japanese culture. This approach to the study of language originates in the work of anthropologists who have used language as a source of information in the general study of “culture.”
Culture

We use the term *culture* to refer to all the ideas and assumptions about the nature of things and people that we learn when we become members of social groups. It can be defined as “socially acquired knowledge.” This is the kind of knowledge that, like our first language, we initially acquire without conscious awareness. We develop awareness of our knowledge, and hence of our culture, only after having developed language. The first language we learn through cultural transmission provides us initially with a ready-made system of categorizing the world around us.

With the words we acquire, we learn to recognize the types of category distinctions that are relevant in our social world. Young children may not initially think of “dog” and “horse” as different types of entities and refer to both as *bow-wow*. As they develop a more elaborated conceptual system along with English as their first language, they learn to categorize distinct types of creatures as *a dog* or *a horse*. In native cultures of the Pacific, there were no horses and, not surprisingly, there were no words for them. In order to use words such as *dog* or *horse*, *snow* or *snowflake*, *father* or *uncle*, *week* or *weekend*, we must have a conceptual system that includes these people, things and ideas as distinct and identifiable categories.
Categories

Although there is a lot of variation among all the individual “dogs” in our experience, we can use the word *dog* to talk about any one of them as a member of the category. A *category* is a group with certain features in common and we can think of the vocabulary we learn as a set of category labels. These are the words for referring to concepts that people in our social world have typically needed to talk about.

It is tempting to believe that there is a fixed relationship between the set of words we have learned (our categories) and the way external reality is organized. However, evidence from the world’s languages would suggest that the organization of external reality actually varies to some extent according to the language being used to talk about it. Some languages may have lots of expressions for types of “rain” or kinds of “coconut” and other languages may have only one or two. Although the Dani of New Guinea can see all colors of the spectrum, they only use names for two of them, equivalents of “black” and “white.” The Inuit of Greenland have names for those two, plus red, green and yellow. English has those five colors, plus blue, brown, purple, pink, orange and gray. It seems that languages used by groups with more technology have more color terms. Observing this difference in basic color terms in languages, we can say that there are conceptual distinctions that are *lexicalized* (“expressed as a single word”) in one language and not in another.
Kinship Terms

Some of the clearest examples of lexicalized categories are words used to refer to people who are members of the same family, or kinship terms. All languages have kinship terms (e.g. brother, mother, grandmother), but they don’t all put family members into categories in the same way. In some languages, the equivalent of the word father is used not only for “male parent,” but also for “male parent’s brother.” In English, we use the word uncle for this other type of individual. We have lexicalized the distinction between the two concepts. Yet we also use the same word (uncle) for “female parent’s brother.” That distinction isn’t lexicalized in English, but it is in other languages. In Watam (spoken in Papua New Guinea), the English word uncle would be translated as either aes (father’s brother) or akwae (mother’s brother). Speakers of Mopan Maya (in Belize, Central America) lexicalize a distinction based on a different conceptual arrangement. Each of the following words (from Danziger, 2001) is, and is not, a translation of the English word uncle.

---

suku’un: older brother and parent’s younger brother

tataa’: parent’s older brother and grandfather

---

A distinction in age among “uncles” is clearly important in Mopan Mayan culture. Other distinctions among relatives can also be lexicalized differently in the world’s languages. In Norwegian, the distinction between “male parent’s mother” (farmor) and “female parent’s mother” (mormor) is lexicalized, but in English the word grandmother is generally used for both. (See Task D, page 311, for more examples.)
Time Concepts

To take a more abstract example, when we learn a word such as week or weekend, we are inheriting a conceptual system that operates with amounts of time as common categories. Having words for units of time such as “two days” or “seven days” shows that we can think of time (i.e. something abstract, with no physical existence) in amounts, using noun phrases, in the same way as “two people” or “seven books” (i.e. something physical). In another worldview, time may not be treated in this way. In the Hopi language, spoken in Arizona, there were traditionally no terms equivalent to most of our time words and phrases (two hours, thirty minutes) because our terms express concepts from a culture operating on “clock time.” Perhaps for a similar reason there was no term for a unit of seven days. There was no “week,” nor was there a term for “Saturday and Sunday” combined as a unit of time. There really was no “weekend.”
Linguistic Relativity

In these examples, we have treated differences in language use as evidence of different ways of talking about external reality. This is often discussed in terms of linguistic relativity because it seems that the structure of our language, with its predetermined categories, must have an influence on how we perceive the world. In its weak version, this idea simply captures the fact that we not only talk, but to a certain extent probably also think about the world of experience, using the categories provided by our language. Our first language seems to have a definite role in shaping “habitual thought,” that is, the way we think about things as we go about our daily lives, without analyzing how we are thinking.

There is a stronger version of this idea, called linguistic determinism, which holds that “language determines thought.” If language does indeed determine thought, then we will only be able to think in the categories provided by our language. For example, English speakers use one word for “snow,” and generally see all that white stuff as one thing. In contrast, Eskimos look out at all the white stuff and see it as many different things because they have lots of different words for “snow.” So, the category system inherent in the language determines how the speaker interprets and articulates experience. We will return to the topic of “snow,” but the proposal just described provides an example of an approach to analyzing the connection between language and culture that dates back to the eighteenth century.
The Sapir–Whorf Hypothesis

The general analytic perspective we are considering is part of what became known as the Sapir–Whorf hypothesis during the middle of the twentieth century. At a time when American linguistics had closer ties to anthropology, Edward Sapir and Benjamin Whorf produced arguments that the languages of native Americans, such as the Hopi, led them to view the world differently from those who spoke European languages. We have already noted a difference between Hopi and English in the treatment of time. According to Whorf, the Hopi perceive the world differently from other tribes (including the English-speaking tribe) because their language leads them to do so. In the grammar of Hopi, there is a distinction between “animate” and “inanimate,” and among the set of entities categorized as “animate” are clouds and stones. Whorf claimed that the Hopi believe that clouds and stones are living entities and that it is their language that leads them to believe this. English does not mark in its grammar that clouds and stones are “animate,” so English speakers do not see the world in the same way as the Hopi. In Whorf’s words, “We dissect nature along lines laid down by our native languages” (see Carroll, Levinson and Lee, 2012).
Against the Sapir–Whorf Hypothesis

It is important to remember that Edward Sapir and Benjamin Whorf did not actually write a book or even an article together advocating the hypothesis that bears their names. There is also some doubt that the theoretical point of view attributed to them was as deterministic as others have argued. Nevertheless, a number of arguments have been presented against the linguistic thinking that was involved. Following Sampson (1980), let us imagine a tribe with a language in which sex differences are marked grammatically, so that the terms used for females, such as *girl* and *woman*, have special markings in the language. On close inspection, we find that these “feminine” markings are also used with the words for *stone* and *door*. Are we forced to conclude that this tribe believes that stones and doors are female entities in the same way as girls and women? This tribe is not an obscure group. They use the expressions *la femme* (“the woman”), *la pierre* (“the stone”) and *la porte* (“the door”). It is the tribe that lives in France. Should we conclude that French speakers believe that stones and doors are “female” in the same way as women?

The problem with the conclusions invited in both the Hopi and French cases is that linguistic classification (“animate,” “feminine”) and biological classification (“living,” “female”) are being confused. There is frequently a correspondence in languages between these classifications, but there does not have to be. Moreover, the linguistic forms do not force us to ignore biological distinctions. While the Hopi language has a linguistic classification for the word *stone*, it does not mean that Hopi truck drivers worry about killing living creatures if they drive over some stones.
Returning to “snow” in cold places, we should first replace “Eskimo” with more accurate terms for the people, Inuit, and their language, Inuktitut. According to Martin (1986), the Inuit of West Greenland have only two basic words for “snow” (qanik, “snow in the air,” and aput, “snow on the ground”). So, from one point of view, we could say that in this language there are really only two words for snow. However, in the same way as speakers of other languages, the Inuit are able to create, from these two basic elements, a large number of common expressions for different snow-related phenomena. Thus it may be more accurate to say they have lots of phrases, rather than words, for referring to snow. Yet, there seems to be no compelling reason to suppose that those expressions are controlling vision or thought among their users. Some expressions will occur frequently in the context of habitual experiences, but it is the human who is thinking about the experience and determining what will be expressed, not the language.
Non-lexicalized Categories

English does lexicalize some conceptual distinctions in the area of “snow,” with sleet, slush and snowflake as examples. We might also include avalanche and blizzard. However, English speakers can also create phrases and other complex expressions, by manipulating their language, to refer to fresh snow, powdery snow, spring snow or the dirty stuff that is piled up on the side of the street after the snow-plow has gone through. These may be categories of snow for English speakers, but they are non-lexicalized (“not expressed as a single word”).

English speakers can express category variation by making a distinction using lexicalized categories (It’s more like slush than snow outside) and also by indicating special reference using non-lexicalized distinctions (We decorated the windows with some fake plastic snow stuff), but most of them will have a very different view of “snow” from the average speaker of Inuktitut.

We inherit a language used to report knowledge, so we would expect that language to influence the organization of our knowledge in some way. However, we also inherit the ability to manipulate and be creative with that language in order to express our perceptions. When the Hopi borrowed the word santi (“Sunday”) from English-speaking missionaries, they used it to refer to the period beginning with one santi and ending with the next santi, essentially developing their own concept of our “week.” If thinking and perception were totally determined by language, then the concept of language change would be impossible. If a young Hopi girl had no word in her language for the object known to us as a computer, would she fail to perceive the object? Would she be unable to think about it? What the Hopi girl can do when she encounters a new entity is change her language to accommodate the need to refer to the new entity. The human manipulates the language, not the other way round.
Cognitive Categories

As a way of analyzing cognition, or how people think, we can look at language structure for clues, not for causes. The fact that Hopi speakers inherit a language system in which clouds have “animate” as a feature may tell us something about a traditional belief system, or way of thinking, that is part of their culture and not ours. In the Yagua language, spoken in Peru, the set of entities with “animate” as a feature includes the moon, rocks and pineapples, as well as people. In the traditions of the Yagua, all these entities are treated as valued objects, so that their cultural interpretation of the feature “animate” may be closer to the concept “having special importance in life” rather than the concept “having life,” as in the cultural interpretation of most English speakers.
Classifiers

We know about the classification of words in languages like Yagua because of grammatical markers called classifiers that indicate the type or “class” of noun involved. For example, in Swahili (spoken in East Africa), different prefixes are used as classifiers on nouns for humans (wa-), non-humans (mi-) and artifacts (vi-), as in *watoto (“children”), *mimea (“plants”) and *visu (“knives”). So, a conceptual distinction exists between raw materials (*miiti, “trees”) and artifacts made from them (*viti, “chairs”) based on the classifiers used. (See Task C, page 310, for more.)

Classifiers are often used in connection with numbers to indicate the type of thing being counted. In the following Japanese examples, the classifiers are associated with objects conceptualized in terms of their shape as “long thin things” (hon), “flat thin things” (mai) or “small round things” (ko).

banana ni- hon (“two bananas”)
syatu ni- mai (“two shirts”)
ringo ni- ko (“two apples”)

The closest English comes to using classifiers is when we talk about a “unit of” certain types of things. There is a distinction in English between things treated as countable (shirt, word, chair) and those treated as non-countable (clothing, information, furniture). It is ungrammatical in English to use *a/an for the plural with non-countable nouns (i.e. *a clothing, *an information, *two furnitures). To avoid these forms, we use classifier-type expressions such as “item of” or “piece of,” as in an item of clothing and two pieces of furniture. The equivalent nouns in many other languages are treated as “countable,” so the existence of a grammatical class of “non-countable entities” is evidence of a type of cognitive categorization underlying the expression of quantity in English. (See Task E, page 311, for more examples.)
Social Categories

Words such as *uncle* or *grandmother*, discussed earlier, provide examples of social categories. These are categories of social organization that we can use to say how we are connected to others. We can provide technical definitions (e.g. “male parent’s brother”), but in many situations a word such as *uncle* is used for many people, including close friends, who are not covered by the technical definition. The word *brother* is similarly used among many groups for someone who is not a family member. We can use these words as a means of social categorization, that is, marking individuals as members of a group defined by social connections.
Address Terms

When a man on the street asks another, *Brother, can you spare a dollar?*, the word *brother* is being used as an address term (a word or phrase for the person being talked or written to). By claiming the kind of closeness in relationship associated with a family member, the speaker’s choice of address term is an attempt to create solidarity (i.e. being the same in social status), perhaps leading to a willingness to hand over some cash. He could have begun his request with “*Sir*” instead, indicating an unequal relationship of power (i.e. being different in social status) and, since he is the one who is clearly higher in status, perhaps *Sir* will hand over some cash.

More typically, an interaction based on an unequal relationship will feature address terms using a title (*Doctor*) or title plus last name (*Professor Buckingham*) for the one with higher status, and first name only for the one with lower status, as in: *Professor Buckingham, can I ask a question?* - *Yes, Jennifer, what is it?* More equal relationships have address terms that indicate similar status of the participants, such as first names or nicknames: *Bucky, ready for some more coffee?* - *Thanks, Jen.*

In many languages, there is a choice between pronouns used for addressees who are socially close versus distant. This is known as the *T/V distinction*, as in the French pronouns *tu* (close) and *vous* (distant). A similar type of social categorization is found in German (*du/Sie*) and Spanish (*tú/usted*). In each of these distinctions, as in older English usage (*thou/you*), the plural form is used to indicate that the speakers do not really have a close relationship. Traditionally, these forms could be used to mark a power relationship. The higher-status or more powerful speaker could use *tu* or *thou* to a lower-status addressee, but not vice versa, as the Quaker Richard Davis discovered to his detriment (described in this chapter’s opening quotation). Lower-status individuals had to use the *vous* forms when addressing those of higher status. This usage is described as non-reciprocal, but the reciprocal use (both speakers using the same form) of the *tu* forms has generally increased in Europe among younger speakers, such as students, who may not know each other really well, but who find themselves in the same situation.

In English, people without special titles are addressed as *Mr., Mrs., Miss*, or *Ms*. Only the women’s address terms include information about their social status. In fact, one address term for a woman indicates that she is the wife of a particular man as in *Mrs. Dexter Smith* (or just *Mrs. Smith*). Dexter is never addressed as *Mr. (Betsy) Cuddlesworth*. When the original system was put in place, women were identified socially through their
relationship to a man, either as wife or daughter. These address terms continue to function
as social category labels, identifying women, but not men, as married or not. A woman
using Ms. as part of her address term is indicating that her social categorization is not based
on her marital status.
Gender

The observation that address terms for men and women are different leads us to a consideration of the most fundamental difference in social categorization, the one based on “gender.” We have already noted the difference between two uses of the word gender in Chapter 7. Biological (or “natural”) gender is the distinction in sex between the “male” and “female” of each species. Grammatical gender is the distinction between “masculine” and “feminine,” which is used to classify nouns in languages such as Spanish (el sol, la luna). A third use is for social gender, which is the distinction we make when we use words like “man” and “woman” to classify individuals in terms of their social roles.

Although the biological distinction (“male, female”) underlies the social distinctions (“father, mother”), there is a great deal about the social roles of individuals as men or women that is unrelated to biology. It is in the sense of social gender, through the process of learning how to become a “boy” or a “girl,” that we inherit a gendered culture. This process can be as simple as learning which category should wear pink versus blue, or as complex as understanding how one category was excluded (by having no vote) from the process of representative government for such a long time. Becoming a social gender also involves becoming familiar with gendered language use.
Gendered Words

In Sidamo, spoken in Ethiopia, there are some words used only by men and some used only by women, so that the translation of “milk” would be *ado* by a man, but *gurda* by a woman. In Japanese, when referring to themselves (“I”), men have traditionally used *boku* and women *watashi* or *atashi*. In Portuguese, saying “thank you” is *obrigado* if you’re a man and *obrigada* if you’re a woman.

These examples simply illustrate that there can be differences between the words used by men and women in a variety of languages. There are other examples, used to talk about men and women, which seem to imply that the words for men are “normal” and the words for women are “special additions.” Pairs such as *hero–heroine* or *actor–actress* illustrate the derivation of terms for the woman’s role from the man’s. Marking this type of difference has decreased in contemporary English as *firemen* and *policemen* have become *firefighters* and *police officers*, but there is still a tendency to treat forms for the man (*his*) as the normal means of reference when speaking generally: *Each student is required to buy his own dictionary*. Other terms, such as *career woman* and *working mother* (rarely “career man” or “working father”) continue the pattern of special terms for women, not men.
Gendered Structures

When we reviewed social variation (Chapter 19), noting the differences between working-class and middle-class speech, we largely ignored gender differences. Yet, within each social class, there is substantial variation according to gender. Generally speaking, whenever there is a higher- versus lower-prestige variable (e.g. talking/talkin’ or I saw it/I seen it), women are more likely to use the higher-prestige forms. The difference is most noticeable among middle-class speakers. In one study of double negatives (e.g. I don’t want none) in lower-middle-class speech, substantially more men (32%) than women (1%) used the structure. This regular pattern of difference is sometimes explained in terms of women’s socialization to be more aware of social status and to be more sensitive to how others may judge them. An alternative explanation appeals to the socialization of men to be strong, tough and independent. Forms which are non-standard or associated with working-class speech may be preferred by men because of their association with manual work, strength and toughness. And tough guys also have deep voices.
Gendered Speech

In general, men have longer vocal tracts, larger larynxes and thicker vocal folds than women. The result is that men speak in a lower pitch range (80–200 Herz) than women (120–400 Herz). The term pitch is used to describe the effect of vibration in the vocal folds, with slower vibration making voices sound lower and rapid vibration making voices sound higher. Although “normal speaking” takes place with substantial overlap in the pitch ranges of men and women, there may be a tendency to exaggerate the differences to sound more “like a man” or more “like a woman.”

Among women speaking American English, there is also generally more pitch movement, that is, more rising and falling intonation. The use of rising intonation (↑) at the end of statements (It happened near San Diego ↑, in southern California ↑), the more frequent use of hedges (sort of, kind of) and tag questions (It’s kind of cold in here, isn’t it?) have all been identified as characteristic of women’s speech. Tag questions are short questions consisting of an auxiliary (don’t, isn’t) and a pronoun (it, you), added to the end of a statement (I hate it when it rains all day, don’t you?). They are used more often by women when expressing opinions. These features of women’s speech all seem to be ways of inviting agreement with an idea rather than asserting it. Men tend to use more assertive forms and “strong” language (It’s too damn cold in here!). Other research has found that women, in same-gender groups, use more indirect speech acts (Could I see that photo?) rather than the direct speech acts (Gimme that photo) heard more often from men in same-gender groups.
Same-Gender Talk

It is important to pay attention to the concept of “same-gender” talk because much of our socialization takes place in such groups. By the time we are three years old, we have established a preference for talking to same-gender others. Throughout childhood, boys socialize in larger groups, often in competitive activities, establishing and maintaining hierarchical relationships (I’m Spiderman and you have to follow me). Girls socialize in smaller groups, more often in co-operative activities, establishing reciprocal relationships and exchanging roles (You can be the doctor now and I’ll be ill). In many societies, this pattern of same-gender socialization is reinforced through separate educational experiences and different social practices.
Gendered Interaction

Many of the features identified in women’s speech seem to facilitate the exchange of turns by allowing others to speak, so that interaction becomes a shared activity. Interaction among men appears to be organized in a more hierarchical way, with “having the floor” being treated as the goal. Men generally take longer turns and, in many social contexts (e.g. religious events), are the only ones allowed to talk.

One effect of these different styles is that certain features become very salient in cross-gender interactions. For example, in same-gender discussions, there is little difference in the number of times speakers interrupt each other. However, in cross-gender interactions, men are much more likely to interrupt women. In same-gender conversations, women produce more back-channels as indicators of listening and paying attention. The term back-channels describes the use of words (yeah, really?) or sounds (hmm, oh) by listeners while someone else is speaking. Men not only produce fewer back-channels, but appear to treat them, when produced by others, as indications of agreement. In cross-gender interaction, the absence of back-channels from men tends to make women think the men are not paying attention to them. The more frequent production of back-channels by women may lead some men to think that the women are agreeing with what they are saying.

The differences we have documented in gendered speech may turn out to be more accurate of an older generation and less marked among younger speakers. There is accumulating evidence that in contemporary society men and women have greater opportunities to construct their own social identities rather than accept traditional roles and are less likely to conform to previous gender stereotypes. This type of social change will be reflected in language change and lead to a better understanding of the idea, noted by Cameron (2007: 152), that “speaking like a woman, or a man, is not just the automatic consequence of being one.”
Study Questions

1 What is one common definition of “culture” in the study of language?

2 What are kinship terms?

3 How do Norwegian and English differ in terms for “parent’s mother”?

4 What is meant by “linguistic determinism”?

5 How many basic terms for snow are found in Inuktitut?

6 What kind of categorization is involved in the English distinction between *sleet* and *slush*: lexicalized or non-lexicalized or non-referential or social?

7 Why is this sentence ungrammatical?

   *She gave me a good advice.

8 Is the following sentence more likely to be spoken by a woman or a man, and why?

   *I think that golf on television is kind of boring, don’t you?*

9 In the Australian language Dyirbal, there are grammatical markers that distinguish different cognitive categories represented by X and Y here.

   X: “men, kangaroos, boomerangs”

   Y: “women, fire, dangerous things”

   (i) If you learn that in Dyirbal, “the sun is the wife of the moon,” in which category would you place “sun” and “moon”?

   (ii) What is the technical term for grammatical markers of this type?

10 What is reciprocal pronoun use?
Tasks

A What is the difference between “cross-cultural”, “intercultural” and “multicultural” communication?

B We noted some differences across languages in the number of words used to describe colors. What is the “basic color term hierarchy”?

C When a number is used with a noun in Ponapean (a language spoken in the western Pacific), an appropriate classifier is also used, as described in Lynch (1998). Some classifiers used as suffixes are -men (“animate things”), -pwoat (“long things”), -mwut (“heaps of things”), -sop (“stalks of things”) and -dip (“slices of things”). Examples of numerals are sili- (“three”) and pab- (“four”). Can you complete these noun phrases with appropriate endings?

Example: pwutak reirei silimen (“three tall boys”)

(1) sehu __________________________ (“four stalks of sugarcane”)

(2) dipen mei __________________________ (“four slices of breadfruit”)

(3) mwutin dippw __________________________ (“four piles of grass”)

(4) nabi pwihk __________________________ (“my three pigs”)

(5) tubke __________________________ (“a tree”)

D According to Foley (1997), kinship terminology in Watam (a language spoken in Papua New Guinea) is rather different from English. The word aes is used for both father and father’s brother, while aem is used for both mother and mother’s sister. The words akwae and namkwae are used for mother’s brother and father’s sister respectively.

(i) Using this information, can you complete the following comparative chart?

(ii) What would be the problems involved in translating the English words aunt and uncle into Watam?

(iii) How do English speakers make a distinction when they’re talking about their father’s brother versus their mother’s brother or their father’s sister versus their mother’s sister?

E We briefly considered a distinction that English makes between “countable” and “non-countable.”

(i) Can you assign the following words to three sets, labeled “countable,” “non-countable” and “both countable and non-countable”?

(ii) Which phrases referring to a “unit of” are typically used with the non-countable nouns (e.g. *a round of applause*)?

applause, business, cash, chocolate, courage, crash, equipment, hair, lesson, luck, mistake, mountain, noise, paper, party, rain, research, rubbish, salmon, sand, shopping, tennis, theft, underwear

F How can we avoid “genderizing” when completing utterances such as these?

1. Everybody came in ________ own car.
2. Someone called, but ______ didn’t leave ______ name.
3. A friend of mine told me _____ had met Brad Pitt in New Orleans.
4. Every student must bring ______ dictionary to class.
5. You won’t be the first or last man or woman who gets ______ involved in a holiday romance.
6. Nicole has a new baby and ______ cries a lot at night.

G Many languages contain “evidentials,” which are markers that indicate how sure the speaker is about the truth or reliability of the information being communicated. Some of these evidential markers can be found in the following examples from Quechua, a language
spoken in Peru and other countries in the Andes region of South America (adapted from Weber, 1986).

(i) Can you identify the three evidential markers being used in the following examples?

(ii) What do you think are the three levels of reliability being expressed here?

H One way in which languages encode cultural concepts differently can be found in their number systems. Some of the basic elements of the number system used in the Rotokas language (spoken on the island of Bougainville, part of Papua New Guinea) are presented in Table 20.1, based on Firchow (1987).

(i) After looking carefully at the way expressions for numbers are constructed, can you translate this number into English?

\[
\text{erao kuku resiura vatara vovota vopeva tau erao vatara}
\]

(ii) If you learn that the word \textit{vavae} also means “hand” in Rotokas, can you describe how the basis of this numbering system differs from English? What are the technical terms used to distinguish between these two numbering systems?
Discussion Topics/Projects

I Why do you think there continue to be frequent references to the idea that “Eskimos have a hundred words for snow”? How would you try to convince someone who thinks this is a fact that it is best treated as a myth? (For background reading, see Chapter 19 of Pullum, 1991.)

II Is there a difference between “interruption” and “overlap” in conversation? What do you think is meant by the distinction between “report talk” and “rapport talk”? Should we distinguish between “fast-talking” and “slow-talking” styles rather than attribute certain features of interaction to men versus women?

(For background reading, see Chapter 7 of Tannen, 1990.)

## Glossary

**AAVE:**  
African American Vernacular English

**accent:**  
aspects of pronunciation that identify where a speaker is from, in contrast to dialect

**acoustic phonetics:**  
the study of the physical properties of speech as sound waves

**acquisition:**  
the gradual development of ability in a first or second language by using it naturally in communicative situations

**acronym:**  
a new word formed from the initial letters of other words (e.g. NASA)

**active voice:**  
the form of the verb used to say what the subject does (e.g. He stole it)

**address term:**  
a word or phrase for the person being talked or written to

**adjacency pair:**  
in conversation, an automatic sequence of a first part from one speaker and a second part from another speaker (How are you? ~ Fine, thanks.)

**adjective (Adj):**  
a word such as happy or strange used with a noun to provide more information
a part of a sentence, typically an adverb or a prepositional phrase, that provides additional information about where, when or how

one of a closely related set of speech sounds or phones

alphabet (alphabetic writing):
a way of writing in which one symbol represents one sound segment

alternate sign language:
a system of hand signals used in a specific context where speech cannot be used (by people who can speak), in contrast to a primary sign language

alveolar ridge:
the rough bony ridge immediately behind the upper front teeth

alveolar:
a consonant produced with the front part of the tongue on the alveolar ridge (e.g. the first and last sounds in dot)

Ameslan (or ASL):
American Sign Language

analogy:
a process of forming a new word that is similar in some way to an existing word

anaphora (anaphoric expressions):
use of pronouns (it) and noun phrases with the (the puppy) to refer back to something already mentioned

anomia:
a language disorder in which it is difficult to find words, often associated with Wernicke’s aphasia

antecedent:
the first mention of someone or something later referred to via anaphora

anticipation:
a type of slip of the tongue in which a sound is used in a word in anticipation of that sound in a following word, as in a tup of tea (“cup of tea”)

antonymy:
the lexical relation in which words have opposite meanings ("Shallow" is an antonym of "deep")

aphasia:
an impairment of language function due to localized brain damage that leads to difficulty in understanding and/or producing language

applied linguistics:
the study of a large range of practical issues involving language in general and second language learning in particular

arbitrariness:
a property of language describing the fact that there is no natural connection between a linguistic form and its meaning

arcuate fasciculus:
a bundle of nerve fibers connecting Broca’s area and Wernicke’s area in the left hemisphere of the brain

article (Art):
a word such as a, an or the used with a noun

articulatory parameters:
the four key aspects of visual information used in the description of signs (shape, orientation, location and movement)

articulatory phonetics:
the study of how speech sounds are produced

ASL (or Ameslan):
American Sign Language

aspiration:
a puff of air that sometimes accompanies the pronunciation of a stop

assimilation:
the process whereby a feature of one sound becomes part of another during speech production

associative meaning:
the type of meaning that people might connect with the use of words (e.g. needle = “painful”) that is not part of referential meaning

audiolingual method:
a mid-twentieth-century approach to language teaching, with repetitive drills used to develop fluent spoken language as a set of habits

auditory phonetics:
the study of the perception of speech sounds by the ear, also called “perceptual phonetics”

auxiliary verb (Aux):
a verb such as will used with another verb

Aux-movement:
in sentence structure, the movement of an auxiliary verb to a position before the subject, often at the front of the sentence

babbling:
the use of syllable sequences (ba-ba) and combinations (ma-ga) by young children in their first year

back-channels:
the use of words (yeab) and sounds (hmm) by listeners while someone else is speaking

backformation:
the process of reducing a word such as a noun to a shorter version and using it as a new word such as a verb (e.g. babysit from babysitter)

background knowledge:
information that is not in a text, but is used from memory by a reader to understand the text
beats:
gestures involving short quick movements of the hands or fingers that go along with the rhythm of talk

bidialectal:
being capable of speaking two dialects

bilabial:
a consonant produced by using both lips (e.g. the first and last sounds in \textit{pub})

bilingual:
a term used to describe a native speaker of two languages or a country with two official languages, in contrast to monolingual

bilingualism:
the state of having two languages

blending:
the process of combining the beginning of one word and the end of another word to form a new word (e.g. \textit{brunch} from \textit{breakfast} and \textit{lunch})

borrowing:
the process of taking words from other languages

bound morpheme:
a morpheme such as \textit{un}- or -\textit{ed} that cannot stand alone and must be attached to another form (e.g. \textit{undressed})

bow-wow theory:
the idea that early human speech developed from imitations of natural sounds in the environment

broadening:
a semantic change in which a word is used with a more general meaning (e.g. \textit{foda} (animal fodder) $\rightarrow$ \textit{food} (any kind)), in contrast to narrowing

Broca’s aphasia:
a language disorder in which speech production is typically reduced, distorted, slow and missing grammatical markers

Broca’s area:
a part of the brain in the left hemisphere involved in speech production

calque:
a type of borrowing in which each element of a word is translated into the borrowing language (e.g. gratte-ciel “scrape sky” for skyscraper)

caregiver speech:
speech addressed to young children by the adult(s) or older children who are looking after them

cataphora:
similar to anaphora, but reversing the antecedent–anaphora relationship, often beginning with a pronoun and a descriptive noun phrase later

category:
a group with certain features in common

characters:
forms used in Chinese writing

classifiers:
grammatical markers that indicate the type or “class” of a noun

clipping:
the process of reducing a word of more than one syllable to a shorter form (e.g. ad from advertisement)

closed syllable:
a syllable that ends with a consonant

coarticulation:
the process of making one sound virtually at the same time as the next sound

coda:
the part of a syllable after the vowel

**cognates:**
words in different languages that have a similar form and meaning (e.g. English *friend* and German *Freund*)

**cognitive category:**
a category used in the organization of how we think

**coherence:**
the connections that readers and listeners create in their minds to arrive at a meaningful interpretation of texts

**cohesion:**
the ties and connections between words that exist within texts

**cohesive ties:**
the individual connections between words and phrases in a text

**co-hyponyms:**
words in hyponymy that share the same superordinate (“daffodil” and “rose” are co-hyponyms of “flower”)

**coinage:**
the invention of new words (e.g. *xerox*)

**collocation:**
a relationship between words that frequently occur together (e.g. *salt and pepper*)

**communication strategy:**
a way of overcoming a gap between communicative intent and a limited ability to express that intent, as part of strategic competence

**communicative approaches:**
approaches to language teaching that are based on learning through using language rather than learning about language

**communicative competence:**

aspects of the grammar, vocabulary and pronunciation of a variety of a language, in contrast to accent

dialect boundary:
a line representing a set of isoglosses, used to separate one dialect area from another

dialect continuum:
the gradual merging of one regional variety of a language into another

dialectology:
the study of dialects

dichotic listening:
an experiment in which a listener hears two different sounds simultaneously, each through a different earphone

diglossia:
a situation where there is a “high” or special variety of a language used in formal situations (e.g. Classical Arabic), and a “low” variety used locally and informally (e.g. Lebanese Arabic)

digraph:
a combination of letters used in writing for a single sound (e.g. “ph” for /f/)

diphthong:
a sound combination that begins with a vowel and ends with another vowel or a glide (e.g. boy)

direct speech act:
an action in which the form used (e.g. interrogative) directly matches the function (e.g. question) performed by a speaker with an utterance, in contrast to an indirect speech act

discourse analysis:
the study of language beyond the sentence, in text and conversation

displacement:
a property of language that allows users to talk about things and events not present in the immediate environment

divergence:
adopting a speech style that emphasizes social distance by using forms that are different from those used by the person being talked to, as a form of speech accommodation, in contrast to convergence

duality:
a property of language whereby linguistic forms have two simultaneous levels of sound production and meaning, also called “double articulation”

</table>
face-threatening act:
saying something that represents a threat to another person’s self-image

filled pause:
a break in the flow of speech, using sounds such as *em* and *er*

finger-spelling:
a system of hand configurations used to represent the letters of the alphabet in sign language

fixed reference:
a property of a communication system whereby each signal is fixed as relating to one particular object or occasion

flap:
a sound produced with the tongue tip briefly touching the alveolar ridge

foreigner talk:
a way of using a language with non-native speakers that is simpler in structure and vocabulary

fossilization:
the process whereby an interlanguage, containing many non-L2 features, stops developing toward more accurate forms of the L2

free morpheme:
a morpheme that can stand by itself as a single word

fricative:
a consonant produced by almost blocking the airflow (e.g. the first and last sounds in *five*)

functional morpheme:
a free morpheme that is used as a function word, such as a conjunction (*and*) or a preposition (*in*)

gender:
a term used in three ways:

(1) a biological distinction between male and female, also called natural gender;
(2) a distinction between classes of nouns as masculine, feminine (or neuter), also called grammatical gender;
(3) a distinction between the social roles of men and women, also called social gender

generative grammar:
a set of rules defining the possible sentences in a language

gestures:
use of the hands, typically while speaking

glides:
sounds produced with the tongue in motion to or from a vowel sound, also called “semi-vowels” or “approximants” (e.g. the first sounds in wet, yes)
glossolalia:
also known as “speaking in tongues,” the production of sounds and syllables in a stream of speech that seems to have no communicative purpose

glottal:
a sound produced in the space between the vocal folds (e.g. the first sound in hat)
glottal stop:
a sound produced when the air passing through the glottis is stopped completely then released

glottis:
the space between the vocal folds

goal:
the semantic role of the noun phrase identifying where an entity moves to (e.g. The boy walked to the window)

gradable antonyms:
words with opposite meanings along a scale (e.g. big–small)

**grammar:**
the analysis of the structure of phrases and sentences

**grammar–translation method:**
the traditional form of language teaching, with vocabulary lists and sets of grammar rules

**grammatical competence:**
the ability to use words and structures accurately as part of communicative competence

**grammatical gender:**
a grammatical category designating the class of a noun as masculine or feminine (or neuter), in contrast to other types of gender

**hedge:**
a word or phrase used to indicate that you are not really sure that what you are saying is sufficiently correct or complete

**holophrastic (utterance):**
a single form functioning as a phrase or sentence in the early speech of young children

**homonyms:**
two words with the same form that are unrelated in meaning (e.g. mole (on skin) – mole (small animal))

**homophones:**
two or more words with different forms and the same pronunciation (e.g. to–too–two)

**hypocorism:**
a word-formation process in which a longer word is reduced to a shorter form with -y or -ie at the end (e.g. telly, movie)

**hyponymy:**
the lexical relation in which the meaning of one word is included in the meaning of another (e.g. “daffodil” is a hyponym of “flower”)
gestures that seem to echo or imitate the meaning of what is said

ideogram (ideographic writing):
a way of writing in which each symbol represents a concept

idiolect:
the personal dialect of an individual speaker

implicature:
an additional meaning conveyed by a speaker adhering to the Co-operative Principle

indirect speech act:
an action in which the form used (e.g. interrogative) does not directly match the
function (e.g. request) performed by a speaker with an utterance, in contrast to a direct
speech act

inference:
additional information used by a listener/reader to create a connection between what is
said and what must be meant

infix:
a morpheme that is inserted in the middle of a word (e.g. -rn- in srnal)

inflectional morpheme:
a bound morpheme used to indicate the grammatical function of a word, also called an
“inflection” (e.g. dogs, walked)

informative signals:
behavior that provides information, usually unintentionally

innateness hypothesis:
the idea that humans are genetically equipped to acquire language

input:
the language that an acquirer/learner is exposed to, in contrast to output

insertion sequence:
in conversation, an adjacency pair that comes between the first and second parts of another pair

| **instrument:** | the semantic role of the noun phrase identifying the entity that is used to perform the action of the verb (e.g. *The boy cut the rope with a razor*) |
| **instrumental motivation:** | the desire to learn an L2, not to join the community of L2-users, but to achieve some other goal, in contrast to integrative motivation |
| **integrative motivation:** | the desire to learn an L2 in order to take part in the social life of the community of L2-users, in contrast to instrumental motivation |
| **interdental:** | a consonant produced with the tongue tip between the upper and lower teeth (e.g. the first sound in *that*) |
| **interlanguage:** | the interim system of L2 learners, which has some features of the L1 and L2 plus some that are independent of the L1 and the L2 |
| **internal change:** | change in a language that is not caused by outside influence, in contrast to external change |
| **isogloss:** | a line on a map separating two areas in which a particular linguistic feature is significantly different, used in the study of dialect |
| **jargon:** | special technical vocabulary associated with a specific activity or topic as part of a register |
| **kinship terms:** | words used to refer to people who are members of the same family that indicate their relationship with other members |

809
L1:
first language, acquired as a child

L2:
second language

labiodental:
a consonant produced with the upper teeth and the lower lip (e.g. the first sounds in
*very* *funny*)

language planning:
choosing and developing an official language or languages for use in government and
education

language typology:
the identification of a language as one of a specific type, often based on word order such
SVO or SOV

larynx:
the part of the throat that contains the vocal folds, also called the voice box

lateralization (lateralized):
divided into a left side and a right side, with control of functions on one side or the other
(used in describing the human brain)

learning:
the conscious process of accumulating knowledge, in contrast to acquisition

lexicalized:
expressed as a single word, in contrast to non-lexicalized

lexical morpheme:
a free morpheme that is a content word such as a noun or verb

lexical relations:
the relationships of meaning, such as synonymy, between words
**lexical rules:**
rules stating which words can be used for constituents generated by phrase structure rules

**lexifier (language):**
the main source of words in a pidgin

**linguistic context:**
the set of other words used in the same phrase or sentence, also called co-text

**linguistic determinism:**
the idea that we can only think in the categories provided by our language, in contrast to linguistic relativity

**linguistic geography:**
the study of language variation based on where different varieties of the language are used

**linguistic relativity:**
the idea that, to some extent, we think about the world using categories provided by our language, in contrast to linguistic determinism

**linguistic variable:**
a feature of language use that distinguishes one group of speakers from another

**liquid:**
a sound produced by letting air flow around the sides of the tongue (e.g. the first sound in *lip*)

**loan-translation:**
a type of borrowing in which each element of a word is translated into the borrowing language, also called calque

**localization view:**
the belief that specific aspects of linguistic ability have specific locations in the brain

**location (in semantics):**

morpheme:
a minimal unit of meaning or grammatical function

morphology:
the analysis of the structure of words

most natural development principle:
in comparative reconstruction, the choice of older versus newer forms on the basis of commonly observed types of sound change

motor cortex:
a part of the brain that controls muscle movement

movement:
an articulatory parameter in ASL describing the type of motion used in forming signs

narrowing:
a semantic change in which a word is used with a less general meaning (e.g. *mete* (any type of food) $\rightarrow$ *meat* (only animal flesh)), in contrast to broadening

nasal:
a sound produced through the nose (e.g. the first sounds in *my name*)

nasalization:
pronunciation of a sound with air flowing through the nose, typically before a nasal consonant

natural class:
a set of sounds with phonetic features in common, such as /p/, /t/ and /k/ in English, which are all voiceless stops

natural gender:
a distinction based on the biological categories of male, female or neither, in contrast to other types of gender

negative face:
the need to be independent and free from imposition, in contrast to positive face

negative transfer:
the use of a feature from the L1 (that is really different from the L2) while performing in the L2, in contrast to positive transfer

negotiated input:
L2 material that an acquirer/learner is exposed to when active attention is drawn to that material during interaction in the L2

a new word

neurolinguistics:
the study of the relationship between language and the brain

non-countable:
type of noun that is not used in English with *a/an or the plural (e.g. *a furniture, *two furnitures), in contrast to countable

non-gradable antonyms:
words which are direct opposites (e.g. alive–dead)

non-lexicalized:
not expressed as a single word, in contrast to lexicalized

pragmatic markers:
short expressions such *You know, I mean* or *Well*, that indicate the speaker’s attitude to the listener or the utterance

pragmatics:
the study of speaker meaning and how more is communicated than is said

prefix:
a bound morpheme added to the beginning of a word (e.g. *unhappy*)

preposition (Prep):
a word such as *in* or *with* used with a noun phrase

prepositional phrase (PP):
a phrase such as *with a dog*, consisting of a preposition plus a noun phrase

prescriptive approach:
an approach to grammar that has rules for the proper use of the language, traditionally based on Latin grammar, in contrast to the descriptive approach

prestige:
higher status

presupposition:
an assumption by a speaker/writer about what is true or already known by the listener/reader

primary sign language:
a sign language that is the first language of a group of people who are typically deaf and do not use a spoken language (e.g. ASL), in contrast to an alternate sign language

an act by which a speaker/writer uses language to enable a listener/reader to identify someone or something

referential meaning:
the basic components of meaning conveyed by the literal use of words, also described as “objective” or “conceptual” meaning

reflexivity:
a special property of human language that allows language to be used to think and talk about language itself

register:
a conventional way of using language that is appropriate in a specific situation, occupation or topic, characterized by the use of special jargon

relation maxim:
the assumption in conversation that you will “be relevant”

reversives:
antonyms in which the meaning of one is the reverse action of the other (e.g. *dress–undress*)

rhyme:
the part of the syllable containing the vowel plus any following consonant(s), also called “rime”

right-ear advantage:
the fact that humans typically hear speech sounds more readily via the right ear

Sapir–Whorf hypothesis:
